The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section means. † Also on other dates. †† Received too late to be included in means and summaries

Reference letters, ^{a}, ^{b}, ^{c} appearing in the table indicate number of missing days; for example, ^{b} represents two days, etc.

Daily Precipitation for December, 1935

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

R. P. POWELL

Vol. XLIII   Parkersburg, W. Va., Year, 1935   No. 13

GENERAL SUMMARY

The annual mean temperature for the State, 53.0°, was slightly above the normal, while the average precipitation, 51.13 inches, was the second heaviest of State record. The snowfall averaged much above the normal, and was exceptionally heavy during December.

January, February, and March were warm, while the spring and early summer months were cool. The temperature was somewhat above the average during July and August, and late fall months. September was unusually cool. December was exceptionally cold, being the third coldest of State record.

Every month received more than the normal precipitation, except February and April, and the averages for those months were only somewhat below the normal. The rainfall during August was exceptionally heavy, and caused flood stages in the Tygart Valley and Little Kanawha rivers, and moderate stages in the Ohio River.

The spring months were unfavorable for farming operations, and planting was considerably retarded. The last killing frosts in the spring occurred generally late in April and the first in the fall, during the latter part of September, making the season of growth shorter than usual.

Cloudiness was much above normal. The sunshine at Parkersburg averaged 44 per cent. of the possible amount, or 2 per cent. below normal. The average at Elkins was 43 per cent., or 2 per cent. below normal.

The wind movement at Parkersburg was 54,167 miles, and at Elkins 52,423 miles.

THE WEATHER BY MONTHS

JANUARY.—A warm month. Precipitation averaged much above the normal, and was well distributed. The last decade of the month was cold, minimum temperatures were below zero during the last week, and ranged from near or slightly below zero in the extreme southern counties to 23° below in the northeastern districts. The snowfall was moderately heavy.

FEBRUARY.—The month was somewhat warmer and drier than usual. Zero temperatures were recorded in some of the northern and mountain districts on the 1st and 17th. The snowfall was much below the normal. The weather was generally favorable for farming activities and considerable plowing was done.

MARCH.—The month was the warmest March since 1921, and the fifth warmest of record Precipitation was unusually heavy in practically all districts. The snowfall was light and unimportant. The conditions were generally favorable for fruit, but farm work was much retarded by frequent rains.

APRIL.—The month was unusually cold, being the coldest April since 1928. The lowest temperature of record for so late in the season occurred at a number of stations on the 16th, when heavy to killing frosts were general, causing great damage to early fruit. The precipitation was practically normal.

MAY.—The month was cold, especially during the first and second decades, when heavy to killing frosts or freezing temperatures occurred. The frost damage was unimportant. The rainfall was generally near or considerably above the normal and quite well distributed. The continued wet weather greatly retarded farm work.

JUNE.—A cool, wet month. The rainfall occurred mostly during thundershowers and was unfavorably distributed. Heavy to excessive rains caused much local damage in scattered localities. On account of the continued cool, wet weather during the first half of the month, planting of corn was considerably retarded.

JULY.—The month was considerably warmer and slightly wetter than usual. Unusually heavy rains occurred during the first and last decades, the 24-hour amounts were the greatest of record for Elkins and Parkersburg. On account of the heavy rains, many fields of corn were damaged and many stacks of hay washed away by marked rises in the rivers and small streams.

AUGUST.—A warm, wet month. The average rainfall, 6.71 inches, was the third heaviest of August State record. The heavy rainfall caused considerable damage to crops over the Little Kanawha and Tygarts Valley watersheds. On account of the continued wet weather during the first half of the month, much grain was damaged in the shock.

SEPTEMBER.—The month was unusually cool, with light to heavy frosts on the 24th and 30th. Temperature readings on the morning of the 30th were the lowest of September record at a number of stations. The rainfall was somewhat heavy and unfavorably distributed throughout the month and over the State. Plowing and fall seeding progressed rapidly, and pastures and meadows were in good condition.

OCTOBER.—The temperature and rainfall averaged slightly above the normal. The first snow of the season occurred at most stations on the 6th. The precipitation was favorably distributed throughout the month and over the State. The weather was favorable for outdoor work, and plowing and seeding progressed rapidly; corn husking made good progress, and potato digging and threshing were completed. The freezing temperature caused little damage, as all crops had matured.

NOVEMBER.—The month was much warmer and slightly wetter than usual. The snowfall was light and unimportant in nearly all the agricultural sections, but moderate snow fell on two or three days in the mountain counties. Weather conditions were mostly favorable for farm work, and corn husking progressed rapidly. A slight earthquake shock was felt over most of the State on the 1st about 1:10 a. m.

DECEMBER.—The coldest December since 1917 and the third coldest of December State record. During the afternoon and evening of the 25th, a severe blizzard, following a windshift line, prevailed over the State, attended by high winds, zero temperatures and heavy snowfall. The average monthly snowfall, 20.5 inches, was the greatest of December State record. Navigable streams over the State were closed to navigation during the cold periods by being frozen or full of heavy floating ice. Thunderstorms occurred generally in the central counties on the 15th. The month was unfavorable for outdoor work.

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

R. P. POWELL

Vol. XLIV Parkersburg, W. Va., January, 1936 No. 1

GENERAL SUMMARY

The month was decidedly cold, the average temperature, 26.7°, being the lowest of January record since 1918. The first half of the month was unusually warm, while the last half was exceptionally cold, with abnormally low temperatures from day to day, during most of the last decade. A severe cold wave overspread the State on the afternoon of the 22d, attended by heavy snow and zero temperatures, and on the 25th, another cold wave covered the State, bringing zero or much below in all districts. The lowest temperatures of January record were reported from a number of stations on the mornings of the 23d or 25th. A low reading of 31° below zero was noted at Reedsville, Preston County, on the morning of the 25th. While the precipitation averaged somewhat above the normal, the number of days with 0.01 inch or more of precipitation was unusually large, as precipitation in the form of rain or snow occurred at some place in the State on every day of the month. The snowfall was exceptionally heavy, being the third heaviest of January State record. Navigable streams of the State were frozen or full of heavy floating ice from the 1st to the 7th, and from the 21st to the end of the month, and navigation was suspended. Sleet was somewhat general throughout the State on the 6th, 17th, and 19th. The weather during most of the month was unfavorable for outdoor work. During the cold weather winter grains were well protected by snow cover and at the close of the month were in fair to good condition. Peach trees were reported injured by the severe cold weather.

TEMPERATURE

The monthly mean for the State, determined from 53 stations, was 26.7°, or 5.8° below the normal. Temperatures were much above the normal from the 2d to the 15th, with the highest readings occurring on the 13th and 14th. The weather was continuously cold from the 22d to the end of the month, the lowest temperatures being noted on the mornings of the 23d, 24th and 25th. The highest monthly mean was 32.6° at Charleston, and the lowest, 21.2° at Terra Alta. The highest temperature was 64° at Gary and Weston on the 14th, and the lowest was 31° below zero at Reedsville on the 25th, making the monthly range for the State 95°.

PRECIPITATION

The average precipitation for the State, determined from 88 stations, was 4.01 inches, which was 0.38 inch more than the normal. Most of the precipitation fell during the first and second decades, the greatest amounts being measured on the 2d, 7th, and 19th. The average monthly snowfall for the State, 16.6 inches, was 8.5 inches greater than the normal. The greatest monthly precipitation was 7.85 inches at Pickens, and the least, 1.84 inches at Dam No. 25, Ohio River. The greatest amount in any 24 consecutive hours was 2.00 inches at Cairo on the 6-7th. The greatest monthly snowfall was 50.5 inches at Pickens. The average number of days with .01 inch or more of precipitation was 16.

RIVER

Flood stages prevailed in the Little Kanawha River on January 3d-4th, caused by heavy rains and melting snow. The following crest stages, in feet and tenths, were noted: Creston, 21.3, and Glenville, 24.2.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or standard mean, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for January, 1936

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

R. P. POWELL

VOL. XLIV PARKERSBURG, W. VA., FEBRUARY, 1936 No. 2

GENERAL SUMMARY

February was unusually cold. The cold weather of December, January, and the first two decades of February made this period one of the coldest of record. Temperatures were generally below zero on the 1st, 8th, 19th, and 20th, with readings from 15° to 25° below zero in many districts on the mornings of the 1st and 8th. The warmest weather prevailed during the last few days of the month, the highest temperatures occurring in nearly all sections on the 25th or 26th. The precipitation averaged much below the normal. The greater portion of the precipitation was snow, and fell mostly during the first half of the month. The total snowfall at Parkersburg for the three months, December, January, and February, was the heaviest of record. On the 7th, a heavy snowstorm, accompanied by high winds and much drifting, demoralized traffic on all highways of the southern section. On the afternoon of the 17th, a cold wave of considerable severity overspread the State, attended by snow and unusually cold weather, temperature readings on the morning of the 19th were generally below zero. Navigable streams of the State were frozen or full of heavy floating ice during most of the month, and navigation was suspended. Sleet, light to heavy, occurred in scattered localities on the 3d, 13th, 14th, 16th, and 17th. As a whole, the month was decidedly unfavorable for outdoor work, which was generally suspended. Winter grains were well protected during the cold periods by a good snow cover, and at the close of the month were generally in fair to good condition.

TEMPERATURE

The average temperature for the northeastern panhandle division was 26.1°, or 6.0° below normal; for the northern division, 27.5°, or 4.9° below normal; for the southern division, 30.8°, or 4.1° below normal; and for the State, 28.4°, or 4.7° below normal. The highest monthly mean temperature was 34.6° at Charleston, and the lowest, 23.4° at Wardensville. The highest temperature was 80° at Robertsburg on the 26th, and the lowest, 25° below zero at Ryan on the 1st, making the monthly range for the State 105°. The greatest daily range was 67° at Reedsville on the 8th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 2.67 inches, or 0.25 inch more than the normal; for the northern division, 2.69 inches, or 0.52 inch below normal; for the southern division, 2.47 inches, or 0.73 inch below normal; and for the State, 2.61 inches, or 0.50 inch below normal. The precipitation was the greatest over the northeastern panhandle and mountain districts, and least in the extreme western counties. The greatest monthly precipitation was 4.94 inches at Pickens, and the least, 0.90 inch, at Dam No. 26, Ohio River. The greatest amount in any 24 consecutive hours was 1.95 inches at Parsons on the 4th. The average monthly snowfall, 10.8 inches, was more than 2.0 inches above normal. The greatest monthly snowfall was 22.2 inches at Beckley. The average number of days with .01 inch or more of precipitation was 9.

MISCELLANEOUS PHENOMENA

Fogs, dense: 1st, 1; 4th, 1; 13th, 3; 14th, 9; 21st, 1; 25th, 1; 26th, 6.

RIVER

Flood stages prevailed in the Little Kanawha River on February 14-15, caused by moderately heavy rains and melting snow. The following crest stages, in feet and tenths, were noted: Creston, 23.9 feet, and Glenville, 24.0 feet.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for February, 1936

VOL. XLIV PARKERSBURG, W. VA., MARCH, 1936 No. 3

GENERAL SUMMARY

The past month was warm and exceptionally wet, the average precipitation, 6.21 inches, was the second heaviest of March State record. Unusually heavy precipitation occurred from the 11th to the 13th, 16th to the 19th, and on the 21st. The 24-hour amounts on the 17th, were exceptionally heavy, Romney received 5.00 inches; McNeill, 4.00 inches; Brandywine, 3.75 inches; Elkins, 3.32 inches; and Richwood, 3.06 inches. The excessive rains and melting snow caused floods in practically all streams of the State, with considerable damage. The Ohio River rose far above the flood stages during the period 17th-23d, with the highest stage of record, 55.5 feet, at Wheeling on the 19th. The greatest monthly amounts of precipitation were received over the northeastern and mountain counties, and the least in the southern districts. Warm weather for the season prevailed on the 4th, 10th, and the last days of the month, with the highest temperatures on the 30th. The coldest weather occurred generally on the 2d, 6th, 14th, and 20th, the lowest readings occurring on the 14th and 20th. The average snowfall, 15.9 inches, was the third heaviest of March State record. The snowfall was unusually heavy in the mountain region and in scattered localities of the central counties. On account of the continued wet weather, field operations were generally suspended, and at the close of the month, plowing, potato planting, and gardening were nearly three weeks late. Meadows and pastures were generally in fair condition and making good growth. Fruit buds were seriously injured by severe weather conditions of the past winter and most peach trees were killed.

TEMPERATURE

The average temperature for the northeastern panhandle division was 44.9°, or 3.9° above normal; for the northern division, 44.5°, or 2.7° above normal; for the southern division, 46.6°, or 3.0° above normal; and for the State, 45.3°, or 2.9° above normal. The highest monthly mean temperature was 50.9° at Charleston, and the lowest, 39.6° at Bayard. The highest temperature was 86° at Hastings on the 30th, and the lowest, 10° at Alpena on the 20th, making the monthly range for the State 76°. The greatest daily range was 57° at Brownsville on the 4th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 7.60 inches, or 4.48 inches above the normal; for the northern division, 6.44 inches, or 2.34 inches above normal; for the southern division, 5.29 inches, or 1.11 inches above normal; and for the State, 6.21 inches, or 2.24 inches above normal. The greatest monthly precipitation was 9.94 inches at Romney, and the least, 3.62 inches at Bens Run. The greatest amount in any 24 consecutive hours was 5.00 inches at Romney on the 17th. The average monthly snowfall, 15.9 inches, was more than 10.0 inches above normal. The greatest monthly snowfall was 68.0 inches at Alpena. The average number of days with .01 inch or more of precipitation was 14.

RIVER

The Ohio River was above the flood stage from March 17th to March 31st, inclusive. The following crest stages, in feet and tenths, were noted: Wheeling, 55.5; Marietta, 48.1; Parkersburg, 48.0; Ravenswood, (Dam 22) 52.1; Pt. Pleasant, 54.4. This was the greatest flood of record at Wheeling.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 3d, 1; 10th, 13; 16th, 1; 18th, 1; 19th, 1; 22d, 2; 24th, 1; 25th, 3; 28th, 1, 31st, 1. *Sleet:* 17th, 4; 18th, 1; 19th, 1.

Thunderstorms: 2d, 2; 3d, 2; 15th, 3; 16th, 8; 17th, 8; 21st, 1; 22d, 1; 24th, 18; 26th, 3; 27th, 10; 31st, 5.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a uormal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the meaus for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for March, 1936

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

R. P. POWELL

VOL. XLIV PARKERSBURG, W. VA., APRIL, 1936 No. 4

GENERAL SUMMARY

April was unusually cool and generally cloudy, with the precipitation averaging slightly above the normal. Temperatures were nearly continuously below the normal during the first half of the month and on the 22-23d, with the lowest readings on the 4th and 8th. Warm weather for the season prevailed during most of the last decade, the highest temperature occurring generally on the 28th and 30th. Freezing temperatures and heavy to killing frosts occurred frequently, but on account of the season being backward little damage resulted. The snowfall was light and unimportant, and fell mostly in the mountain districts. Owing to frequent rains and continued cool weather, the first half of the month was unfavorable for farm work, and plowing and planting were considerably retarded. During the last half, plowing progressed rapidly, and planting of potatoes and sowing of oats were nearly completed. Progress and condition of winter wheat was poor to fair. Pastures and meadows were in fair condition and making good growth.

TEMPERATURE

The average temperature for the northeastern panhandle division was 48.4°, or 1.5° below normal; for the northern division, 48.2°, or 2.7° below normal; for the southern division, 51.4°, or 1.6° below normal; and for the State, 49.3°, or 2.4° below normal. The highest monthly mean temperature was 55.5° at Charleston, and the lowest, 43.8° at Alpena. The highest temperature was 90° at Hastings on the 30th, and the lowest was 12° at Beckley on the 4th, and Pickens on the 8th, making the monthly range for the State 78°.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 2.86 inches, or 0.20 inch below the normal; for the northern division, 3.84 inches, or 0.17 inch above normal; for the southern division, 3.71 inches, or 0.23 inch above normal; and for the State, 3.66 inches, or 0.15 inch above normal. The greatest monthly precipitation was 6.28 inches at Davis, and the least, 2.03 inches at Wardensville. The greatest amount in any 24 consecutive hours was 2.36 inches at Pt. Pleasant on the 6th. The average monthly snowfall, 1.4 inches, was 0.5 inch less than the normal. The average number of days with .01 inch or more of precipitation was 12.

RIVER

Heavy rains on the 5-6th caused a slight flood in the Little Kanawha River and in the Ohio River at Pt. Pleasant. A crest stage of 23.5 feet was reached at Glenville and 21.9 feet at Creston on the 6th. The crest at Dam 25, Ohio River, was 44.9 feet, and Pt. Pleasant, 42.2 feet on the 8th.

LIGHT HAIL

Light hail, doing no damage, fell in sections of the following counties on dates given: Berkeley, 3d; Cabell, 2d and 5th; Hampshire, 2d; Kanawha, 5th and 13th; Nicholas, 2d and 5th; Pleasants, 6th; Preston, 12th and 21st; Raleigh, 2d and 12th; Roane, 5th; Taylor, 7th; Wetzel, 21st.

MODERATE HAIL

Moderately heavy hail fell in St. Albans, Kanawha County, on the 1st; New Martinsville, Wetzel County, on the 5th; and Reedsville, Preston County, on the 15th. Size of hailstones varied, a few being as large as a small marble. There was practically no damage.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for April, 1936

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

R. P. POWELL

VOL. XLIV   PARKERSBURG, W. VA., MAY, 1936   No. 5

GENERAL SUMMARY

The month was warm and unusually dry, with an abundance of sunshine. Except for a few short periods, unseasonably warm weather prevailed during the month, with maximum temperature much above 90° on from six to eight days. Cool weather for the season occurred on the 5th, 15th, and 29th, the temperatures on the 29th were the lowest of record for so late in the season at a few stations. Light to heavy frosts formed on the mornings of the 15th and 29th, with little damage. The average rainfall, 1.99 inches, was less than one-half of the normal, making it the driest May since 1914, and the third driest May of State record. A deficiency in rainfall occurred at all stations, except two, Elkins and Hinton. In some scattered localities the rains were too light to moisten the soil. During the last ten days of the month very little rain fell in the southern and western counties, and droughty conditions were becoming serious at the end of the month. There were many stations having from 10 to 12 consecutive days without measurable precipitation. The cool weather during the last few days of the month together with the lack of moisture, greatly retarded the growth of all crops. Corn was mostly planted and some being cultivated. On account of dry soil, many fields of early corn were replanted. Oats and wheat were generally in poor to fair condition and heading very short. Potatoes and pastures were generally poor and making slow growth.

TEMPERATURE

The average temperature for the northeastern panhandle division was 62.8°, or 2.4° above normal; for the northern division, 63.4°, or 2.2° above normal; for the southern division, 65.6°, or 3.4° above normal; and for the State, 64.1°, or 2.4° above normal. The highest monthly mean temperature was 69.0° at Hastings and Ravenswood, and the lowest, 56.6° at Bayard. The highest temperature was 100° at Hastings on the 7th, 8th, and 9th, and the lowest was 25° at Alpena on the 15th, and Bayard on the 29th, making the monthly range for the State 75°. The greatest daily range was 59° at Brownsville on the 11th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 1.89 inches, or 1.81 inches below the normal; for the northern division, 2.08 inches, or 2.03 inches below normal; for the southern division, 1.88 inches, or 2.09 inches below normal; and for the State, 1.99 inches, or 1.98 inches below normal. Most of the precipitation was received on the 3d-4th, 12-14th, 18-19th, and 26-27th, the greatest amounts being measured on the 13-14th, and 18-19th. The greatest monthly precipitation was 4.30 inches at Elkins, and the least, 0.62 inch at New Martinsville. The greatest amount in any 24 consecutive hours was 2.14 inches at Kanawha Falls on the 13th. The average number of days with .01 inch or more of precipitation was 6.

LIGHT HAIL

Light hail occurred in sections of the following counties on dates given: Berkeley, 19th; Hampshire, 18th; Randolph, 3d; Tucker, 12th and 18th.

MODERATE HAIL

Moderately heavy hail fell in and near Martinsburg, Berkeley County, on the 14th, and Parkersburg, Wood County, on the 13.h. Practically no damage resulted.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Vol. XLIV Parkersburg, W. Va., June 1936 No. 6

GENERAL SUMMARY

The past month was exceptionally dry, being the driest June of State record. The average rainfall, 2.41 inches, was about one half of the normal. The outstanding dry Junes were in 1895, 1930, and 1933, when the averages were 2.92, 2.87, and 2.75 inches, respectively. One of the most severe droughts of record for the State during the growing season prevailed throughout the month, being most severe in the western and central counties. The rains occurred during thundershowers and were unfavorably distributed throughout the month and over the State. There were some scattered stations that had from 12 to 15 consecutive days without measurable precipitation. The temperature averaged somewhat above the normal, with the highest readings on the 3d, 17th, and 30th, and the lowest occurred generally on the 1st, 2d, 5th, and 25th. Crops suffered severely from high temperatures and lack of moisture, and at the close of the month, potatoes were in poor condition and slowly drying up, and pastures and meadows were burned brown. Corn suffered considerably from the drought and was generally in poor to fair condition. Heavy local showers and high winds caused some damage to crops in scattered localities.

TEMPERATURE

The average temperature for the northeastern panhandle division was 68.9°, or 1.4° above normal; for the northern division, 70.0°, or 1.0° above normal; for the southern division, 72.0°, or 1.9° above normal; and for the State, 70.5°, or 0.9° above normal. The highest monthly mean temperature was 75.8° at Huntington, and the lowest, 62.2° at Pickens. The highest temperature was 105° at Hastings on the 17th, and the lowest was 32° at Brownsville on the 2d, making the monthly range for the State 73°. The greatest daily range was 59° at Hastings on the 29th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 3.69 inches, or 0.21 inch below the normal; for the northern division, 2.61 inches, or 1.83 inches below normal; for the southern division, 1.62 inches, or 2.79 inches below normal; and for the State, 2.41 inches, or 1.91 inches below normal. The greater portion of the precipitation was received on the 4th, 7-8th, 11-12th, 18th, and 30th, the greatest amounts being recorded on the 4th, 7th, and 30th. The greatest monthly precipitation was 5.34 inches at Harpers Ferry, and the least, 0.37 inch at Dam 19, Ohio River. The greatest amount in any 24 consecutive hours was 3.00 inches at Fairmont on the 7th. The average number of days with .01 inch or more or precipitation was 7.

LIGHT HAIL

Light hail fell in sections of the following counties on dates given: Pendleton, 4th and 18th; Randolph, 7th and 30th; Lewis, Mingo, Raleigh, and Wood, 30th.

HEAVY HAIL

Moderate to heavy hail fell in and near Martinsburg, Berkeley County on the 4th and 14th, with little damage. Heavy hail fell at Reedsville, Preston County on the 8th; the stones were about the size of a small marble and caused practically no damage. Moderate hail fell at Bens Run, Tyler County on the 23d; Parsons, Tucker County, and Ryan, Roane County, on the 30th, with no damage.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 6th, 1; 8th, 1; 9th, 2; 12th, 1; 13th, 4; 14th, 1; 17th, 1; 19th, 3; 20th, 5; 21st, 2; 24th, 1; 25th, 5.

Thunderstorms: 3d, 2; 4th, 5; 6th, 2; 7th, 9; 8th, 6; 10th, 2; 11th, 12; 12th, 1; 16th, 1; 18th, 12; 19th, 1; 27th, 1; 28th, 2; 30th, 20.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for June 1936

R. P. POWELL

VOL. XLIV PARKERSBURG, W. VA., JULY 1936 NO. 7

GENERAL SUMMARY

The month was abnormally warm with a large percentage of sunshine. Although the rainfall averaged somewhat above normal, there were many stations that received unusually light amounts, especially the middle Ohio River counties, thence eastward into the central districts, and in some sections of the Great Kanawha Valley. About sixty percent of the month's rainfall occurred during the last eight days. The rainfall occurred mostly during thundershowers and was unfavorably distributed over the State, with the greatest monthly amounts over the mountain and northeastern counties, and least in the western districts. After the first five days, the month was nearly continuously warm, with maximum temperatures of 100° or above on from five to nine days. Many stations reported the highest temperatures of July record. There were several local excessive rains and heavy hail storms, attended by high winds, causing some damage to crops and buildings in the northern and northeastern counties. The rainfall over the western counties and Little and Great Kanawha Valleys was insufficient for crop growth the entire month. Pastures were seriously injured and many fields were burned brown. In some districts corn was curling badly and beginning to tassel on short stalks.

TEMPERATURE

The average temperature for the northeastern panhandle division was 74.4°, or 2.1° above normal; for the northern division, 74.4°, or 1.2° above normal; for the southern division, 76.7°, or 3.1° above normal; and for the State, 75.2°, or 2.1° above normal. The highest monthly mean temperature was 80.8° at Huntington, and the lowest, 67.0° at Pickens. The highest temperature was 112° at Martinsburg on the 10th, and the lowest was 35° at Bayard on the 31st, making the monthly range for the State 77°. The greatest daily range was 50° at New Cumberland on the 30th and 31st.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 4.92 inches, or 1.35 inches above normal; for the northern division, 5.58 inches, or 0.87 inch above normal; for the southern division, 4.49 inches, or 0.01 inch above normal; and for the State, 5.10 inches, or 0.52 inch above normal. The greater portion of the precipitation was received on the 1st, 5th, 11th, 24th, and 28-29th, the greatest amounts being recorded on the 1st, 5th, 24th, and 28th. The greatest monthly precipitation was 9.75 inches at McNeill, and the least, 0.85 inch at Cairo. The greatest amount in any consecutive hours was 4.04 inches at Parsons on the 5th. The average number of days with .01 inch or more of precipitation was 10.

LIGHT HAIL

Light hail fell in sections of the following counties on dates given: Mason, 11th; Marion, 16th and 17th; Fayette, 26th; Randolph, 28th.

MODERATE HAIL

Moderate hail fell at New Cumberland, Hancock County on the 10th; Williamson, Mingo County on the 16th, and Bens Run, Tyler County on the 26th, with little damage.

HEAVY HAIL

Heavy hail fell at McNeill, Hardy County on the 10th; the stones were about the size of small marbles and caused considerable damage to crops. Heavy hail fell in and near Martinsburg, Berkeley County on the 28th; the stones ranged in size from 1/4 to 3/4 inch in diameter. Damage was confined mostly to crops.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 2d, 1; 4th, 1; 5th, 1; 6th, 3; 7th, 3; 8th, 3; 9th, 2; 10th, 1; 14th, 1; 22d, 1; 25th, 1; 30th, 2; 31st, 4. *Thunderstorms:* 1st, 2; 2d, 3; 3d, 1; 4th, 10; 5th, 12; 6th, 3; 10th, 8; 11th, 7; 12th, 6; 13th, 2; 14th, 6; 15th, 3; 16th, 2; 17th, 1; 18th, 1; 23d, 12; 24th, 11; 25th, 4; 26th, 4; 27th, 12; 28th, 11; 31st, 5.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for July 1936

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

R. P. POWELL

Vol. XLIV   Parkersburg, W. Va., August 1936   No. 8

GENERAL SUMMARY

The month was decidedly warm, being the warmest August since 1918, and the fourth warmest of August State record. The month was characterized by nearly continuously warm weather, the temperature being below normal on only four or five days, two short periods. Temperature readings of 100° or above occurred at a number of stations from the 19th to the 23d. Moderately cool weather for the season prevailed on the first and last few days of the month, with the lowest readings occurring generally on the 1st. This was the fourth consecutive warm month. The rainfall averaged slightly below normal with the greatest monthly amounts in the central and mountain counties, and the least in the western districts. On account of the warm, dry weather, the month was generally unfavorable for growth and farm work. Early planted corn was being cut with fair to good yield. Potatoes were mostly good in the mountain sections, but elsewhere the crop was generally short, many fields were a complete failure. Pastures and meadows were short in most districts.

TEMPERATURE

The average temperature for the northeastern panhandle division was 74.2°, or 3.6° above normal; for the northern division, 74.6°, or 3.2° above normal; for the southern division, 76.6°, or 4.3° above normal; and for the State, 75.2°, or 3.5° above normal. The highest monthly mean temperature was 80.0° at Huntington, and the lowest, 64.5° at Pickens. The highest temperature was 105° at Bancroft on the 22d, Cairo, 11th, and Huntington and Ravenswood, 21st, and the lowest was 36° at Bayard on the 1st, making the monthly range for the State 69°. The greatest daily range was 49° at Cairo on the 27th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 3.50 inches, or 0.24 inch below normal; for the northern division, 4.29 inches, or 0.09 inch above normal; for the southern division, 3.65 inches, or 0.40 inch below normal; and for the State, 3.96 inches, or 0.12 inch below normal. The greater portion of the precipitation was received on the 5-7th, 11th, 14-16th, and from the 24th to the 29th, the greatest amounts being recorded on the 5th, 16th, 19th, and 26th. The greatest monthly precipitation was 7.44 inches at Janelew, and the least, 1.49 inches at Cairo. The greatest amount in any 24 consecutive hours was 3.25 inches at Horner on the 19th. The average number of days with .01 inch or more of precipitation was 11.

LIGHT HAIL

Light hail fell in sections of the following counties on dates given: Hancock, 19th; Marion, 16th.

HEAVY HAIL

Heavy hail fell near Martinsburg, Berkeley County on the 27th; the stones were about the size of a small marble and caused some damage to crops.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for August 1936

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

R. P. POWELL

Vol. XLIV Parkersburg, W. Va., September 1936 No. 9

GENERAL SUMMARY

The month was considerably warmer and much drier than the average September. The daily temperatures, with few exceptions, were continuously above the normal, with the highest readings occurring generally from the 11th to the 16th. This was the fifth consecutive month with the temperatures averaging above the normal. Cool weather for the season prevailed on the 25th and 26th, with freezing temperatures and heavy frosts. The frost damage was confined to the mountain counties. A low reading of 25° was recorded at Bayard on the 25th. While the rainfall averaged much less than the normal, there were a few stations that received amounts in excess of the normal. There were a number of stations that had from 15 to 20 consecutive days without measurable precipitation. On account of the unusually long period of dry weather in sections of the central and western counties, many springs and wells failed, and it was necessary to haul water for domestic use and stock. At the close of the month, corn cutting was progressing rapidly and many fields were in shock, and fall plowing and seeding were general. Pastures improved locally, but were generally short, and in some counties dried up.

TEMPERATURE

The average temperature for the northeastern panhandle division was 67.8°, or 2.8° above normal; for the northern division, 69.1°, or 2.6° above normal; for the southern division, 70.7°, or 3.8° above normal; and for the State, 69.4°, or 2.9° above normal. The highest monthly mean temperature was 74.0° at Huntington, and the lowest, 62.3° at Bayard. The highest temperature was 99° at Bancroft and Point Pleasant on the 14th, and the lowest was 25° at Bayard on the 25th, making the monthly range for the State 74°. The greatest daily range was 57° at McNeill on the 27th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 1.22 inches, or 1.56 inches below normal; for the northern division, 1.87 inches, or 1.20 inches below normal; for the southern division, 1.98 inches, or 0.79 inch below normal; and for the State, 1.82 inches, or 1.11 inches below normal. The greater portion of the precipitation was received on the 2-3d. 8-9th, 24-25th, and 29-30th, the greatest amounts being recorded on the 4th, 9th, 29th and 30th. The greatest monthly precipitation was 3.96 inches at Wellsburg, and the least, 0.68 inch at Upper Tract and Wardensville. The greatest amount in any 24 consecutive hours was 3.43 inches at Wellsburg on the 29th.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

R. P. POWELL

Vol. XLIV Parkersburg, W. Va., October 1936 No. 10

GENERAL SUMMARY

The past month, with the temperature averaging much above normal, was the sixth consecutive warm month in West Virginia. Temperatures were mostly near or above the normal until near the close of the month, when freezing temperatures and heavy to killing frosts occurred, but on account of the lateness of the season, the cold weather caused but little damage. The precipitation was generally near or considerably above the normal and quite favorably distributed, the greatest amounts being received in the northeastern panhandle districts, and the least in scattered sections of the central counties. The rainfall was unusally heavy in many sections of the State on the 17th, and the 24-hour amounts were excessive in most of the northeastern counties. Light snow or snow flurries occurred in some of the mountain counties near the close of the month. The weather during most of the month was favorable for apple picking, corn husking, and farm work. Meadows and pastures were much improved by the warm, wet weather, and winter grains were in excellent condition and making good growth.

TEMPERATURE

The average temperature for the northeastern panhandle division was 55.9°, or 2.6° above normal; for the northern division, 55.7°, or 1.4° above normal; for the southern division, 57.9°, or 2.6° above normal; and for the State, 56.5°, or 1.9° above normal. The highest monthly mean temperature was 60.8° at Ravenswood, and the lowest, 49.8° at Terra Alta. The highest temperature was 89° at Madison on the 9th, and Ravenswood on the 10th, and the lowest was 12° at Alpena on the 28th, making the monthly range for the State 77°. The greatest daily range was 56° at McNeill on the 20th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 4.73 inches, or 2.14 inches above normal; for the northern division, 3.83 inches, or 0.91 inch above normal; for the southern division, 3.68 inches, or 0.95 inch above normal; and for the State, 3.89 inches, or 1.08 inches above normal. The greater portion of the precipitation was received from the 6-11th, 16-18th, and on the 23d and 26th, the greatest amounts being measured on the 7th, 10th, 17th, and 26th. Light snow or snow flurries occurred in the mountain sections on the 26th, 27th, 29th, and 30th. The greatest monthly precipitation was 7.50 inches at Pickens, and the least, 2.07 inches at Roanoke. The greatest amount in any 24 consecutive hours was 3.75 inches at Martinsburg on the 17th.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 2d, 10; 3d, 8; 4th, 6; 5th, 4; 6th, 1; 7th, 1; 8th, 1; 9th, 3; 12th, 1; 13th, 3; 14th, 6; 15th, 5; 16th, 1; 17th, 1; 19th, 4; 20th, 2; 21st, 3; 22d, 2; 23d, 2; 24th, 3; 25th, 9; 28th, 3; 31st, 1.

MISCELLANEOUS PHENOMENA (Continued)

Corona, lunar: 20th, 1 (Huntington).

Hail, light: 11th, 1 (Martinsburg).

Halo, lunar: 25th, 1 (Hinton).

Thunderstorms: 6th, 2; 7th, 2; 8th, 2; 9th, 2; 10th, 7; 11th, 1.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for October 1936

VOL. XLIV PARKERSBURG, W. VA., NOVEMBER 1936 No. 11

GENERAL SUMMARY

Temperatures were below the seasonal normal through nearly the entire month, only a few days were above normal. The warmest weather occurred in practically all districts on the 2d or 3d, and the coldest on the 19th, and from the 27th to the close of the month. Temperatures were unusually low on the mornings of the 19th and 28th, with a low reading of 1 degree at Rainelle on the 28th. The average precipitation was slightly less than the normal, and was unfavorably distributed, as about 80 percent of the month's precipitation fell during the first five days. From the 6th to the close of the month very little precipitation occurred in any section of the State, and there were a number of stations that had from 12 to 15 consecutive days without measurable precipitation. The greatest monthly amounts of precipitation were received in the central and Ohio River counties, and the least in the northeastern panhandle section. While the snowfall averaged somewhat below normal, the amounts were moderately heavy in scattered localities of the mountain districts, and fell mostly on the 15th, 26th, and 27th. Weather conditions were generally favorable for field work, and harvesting of corn and potatoes progressed rapidly, and was nearing completion at the close of the month. Winter grains were mostly in good condition, and pastures were green in many localities as the month closed.

TEMPERATURE

The average temperature for the northeastern panhandle division was 41.4°, or 1.1° below normal; for the northern division, 40.6°, or 2.5° below normal; for the southern division, 42.2°, or 1.5° below normal; and for the State, 41.3°, or 2.0° below normal. The highest monthly mean temperature was 44.5° at Ravenswood, and the lowest, 36.4° at Alpena. The highest temperature was 85° at Hinton on the 3d, and the lowest was 1° at Rainelle on the 28th, making the monthly range for the State 84°. The greatest daily range was 50° at Lost Creek on the 11th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 1.27 inches, or 0.88 inch below normal; for the northern division, 2.93 inches, or 0.02 inch below normal; for the southern division, 2.56 inches, or 0.15 inch below normal; and for the State, 2.54 inches, or 0.22 inch below normal. The greater portion of the precipitation was received from the 1st-6th, 9th, and 26th, the greatest amounts being measured on the 2d, 4th, and 5th. The greatest monthly precipitation was 4.19 inches at Point Pleasant, and the least, 0.59 inch at Kearneysville. The average snowfall, 1.8 inches, was 0.4 inch less than normal. The greatest monthly snowfall was 16.0 inches at Davis. The greatest amount of precipitation in any 24 consecutive hours was 2.49 inches at Cairo on the 4th.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 4th, 1; 6th, 6; 7th, 8; 8th, 8; 9th, 5; 11th, 11; 12th, [illegible]; 13th, [illegible]; 14th, 12; 15th, 1; 17th, 1; 18th, 1; 19th, 2; 20th, 4; 22d, 1; 23d, 4; 25th, 4; 29th, 2; 30th, 4.

Halo, lunar: 15th, 1 (Grafton).

Corona, lunar: 27th, 1 (Huntington).

Sleet: 2d, 1 (Wellsburg).

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for November 1936

VOL. XLIV PARKERSBURG, W. VA., DECEMBER 1936 No. 12

GENERAL SUMMARY

The month as a whole was unusually warm, the average temperature for the State, 37.2°, was much above the normal. The weather was abnormally warm during the closing days of the month, with maximum temperatures near or slightly above the December record at many stations. The lowest temperatures occurred generally on the 1st, 13th, and 23d, the readings on the 23d were somewhat below zero in scattered localities of the mountain districts. The precipitation averaged somewhat above the normal in the northern and southern sections, and considerably above the normal in the northeastern panhandle counties. The greatest monthly amounts were received in the mountain sections, and the least in the extreme northern Ohio River counties. While the snowfall averaged much below the normal, the monthly amounts were moderately heavy in the mountain districts. Sleet was reported from scattered sections on the 1st, 2d, 6th, 9th, 12th, 19th, and 20th. The weather during the month was mostly favorable for outdoor work. The frequent moisture was very beneficial to late pastures and winter grains. Stock remained in the open during practically the entire month.

TEMPERATURE

The average temperature for the northeastern panhandle division was 34.0°, or 1.0° above normal; for the northern division, 37.5°, or 3.1° above normal; for the southern division, 38.1°, or 2.9° above normal; and for the State, 37.2°, or 2.6° above normal. The highest mean temperature was 42.2° at Hastings, and the lowest, 29.0° at Terra Alta. The highest temperature was 70° at Brownsville on the 25th, 30th, and 31st; Ravenswood, 29th, and Robertsburg 29th and 30th, and the lowest, 8° below zero at Bayard on the 23d, making the monthly range for the State 78°. The greatest daily range was 58° at Bayard on the 23d.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 3.93 inches, or 1.40 inches above normal; for the northern division, 4.17 inches, or 0.57 inch above normal; for the southern division, 3.85 inches, or 0.52 inch above normal; and for the State, 4.02 inches, or 0.68 inch above normal. Most of the precipitation fell during the first and second decades, the greatest amounts being measured on the 6th, 7th, 11th, and 19th. The greatest monthly precipitation was 6.30 inches at Terra Alta, and the least, 2.32 inches at Wellsburg. The greatest amount in any 24 consecutive hours was 2.09 inches at Bens Run on the 6th. The average monthly snowfall, 4.5 inches, was 1.8 inches less than the normal. The greatest monthly snowfall was 20.0 inches at Stony River Dam. The average number of days with .01 inch or more of precipitation was 11.

MISCELLANEOUS PHENOMENA
(Dates and number of stations reporting)

Fogs, dense: 2d, 1; 3d, 2; 4th, 1; 5th, 2; 7th, 1; 10th, 1; 11th, 3; 12th, 4; 13th, 3; 14th, 3; 15th, 3; 16th, 5; 17th, 16; 18th, 2; 22d, 1; 24th, 2; 25th, 2; 26th, 1; 28th, 4; 29th, 2; 31st, 1.

Halos, lunar: 25th, 2; 26th, 1.

Sleet: 1st, 2; 2d, 6; 6th, 1; 9th, 2; 12th, 1; 19th, 10; 20th, 2.

Thunderstorm: 30th, 1 (Hastings).

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for December 1936

UNIVERSITY OF ILLINOIS

WEST VIRGINIA SECTION

R. P. POWELL

Vol. XLIV Parkersburg, W. Va., Year, 1936 No. 13

GENERAL SUMMARY

The year averaged somewhat above normal in temperature and slightly below in precipitation. The average snowfall, 51.0 inches, was the third heaviest of State record. Excessive rains and melting snow during March caused floods in practically all streams of the State. The greatest flood of record, 55.5 feet, occurred at Wheeling, W. Va., on March 19th.

The winter months were unusually cold, while April and November averaged somewhat below the normal. March was warm, and the summer and early fall seasons were above the normal.

Wet weather prevailed generally during January, March, April, July, October, and December, but the precipitation was generally deficient during the summer months, and conditions were droughty, causing much damage to crops.

The season of growth for ripening of all crops, extended from the middle of April to the latter part of October, being somewhat longer than usual.

Cloudiness was slightly below normal. The sunshine at Parkersburg averaged 47 per cent of the possible amount, or practically normal. The average at Elkins was 51 per cent or 7 per cent above normal.

The wind movement at Parkersburg was 55,374 miles, and at Elkins 52,059.

THE WEATHER BY MONTHS

JANUARY.—A cold, wet month. Temperatures were unusually low during the last decade, with heavy snow. Navigable streams of the State were frozen or full of heavy ice from the 1st to the 7th, and from the 21st to the end of the month.

FEBRUARY.—The month was unusually cold with temperatures below zero on the 1st, 8th, 19th, and 20th. The precipitation averaged much below normal, and fell mostly during the first half of the month. Navigable streams of the State were frozen or full of heavy ice during most of the month, and navigation was suspended.

MARCH.—A warm, wet month. Excessive rains and melting snow caused a serious flood in the Parkersburg River District from the 17th to the 23d. Fruit buds were seriously injured by severe weather conditions

Reference letters indicate number of days missing; [a] one day, [b] two days, etc. * Interpolated

THE WEATHER BY MONTHS—Continued

of the past winter, and most peach trees were killed.

APRIL.—Cool and generally cloudy, with precipitation averaging slightly above normal. Heavy to killing frosts occurred frequently, but on account of the season being backward, little damage resulted.

MAY.—A warm, dry month. In some scattered districts the rains were too light to moisten the soil. Cool weather during the last few days of the month, together with the lack of moisture, greatly retarded the growth of crops. Oats and wheat were generally in poor to fair condition and heading very short.

JUNE.—Driest June of State record. One of the most severe droughts of record for the State during the growing season, and crops suffered severely. Potatoes were in poor condition and slowly drying up, and pastures and meadows were burned brown. The temperature averaged somewhat above the normal.

JULY.—The month was abnormally warm and somewhat wet. Many stations reported the highest temperatures of July record. The rainfall over the western counties was insufficient for crop growth, and pastures were seriously injured, and many fields were burned brown.

AUGUST.—A warm, dry month. Temperature readings of 100 degrees or above occurred generally from the 19th to the 23d. On account of the warm, dry weather, the month was unfavorable for growth and farm work.

SEPTEMBER.-The month was decidedly warm and somewhat dry. Unusually high temperatures prevailed from the 11th to the 16th. Corn cutting progressed rapidly during the month, and many fields were in shock, and fall plowing and seeding were general.

OCTOBER.-A warm, wet month. Near the close of the month freezing temperatures and killing frosts occurred, but on account of the lateness of the season, the cold weather caused but little damage. The weather was generally favorable for apple picking, corn husking, and farm work.

NOVEMBER.-The month was somewhat colder and slightly drier than usual, with temperatures near zero in the mountain districts on the mornings of the 19th and 27th. The snowfall was light and unimportant. Winter grains were mostly in good condition, and pastures were green in many localities as the month closed.

DECEMBER.-The weather during December was mild with more than the average precipitation. The snowfall was much below normal, and the ground was bare during most of the month. Winter grains were in fair to good condition, and pastures were green in some districts.

ERRATA

Correct Monthly Climatological Data for 1936 to read:

February: Robertsburg—Mean minimum temperature, 13.7; Mean temp., 28.2.
June: Clarksburg—Evaporation, should be 6.852.
October: Glenville—Mean temperature, 57.6.

VOL. XLV PARKERSBURG, W. VA., JANUARY 1937 No. 1

GENERAL SUMMARY

January 1937 was remarkably wet. The average monthly precipitation, 8.50 inches, was more than twice the normal, and considerably in excess of any previous January State record. Precipitation occurred frequently throughout the month, but from the 10th to the 25th was almost continuous, and during some of the time unusually heavy, causing a serious and destructive flood, the second greatest of record along the Ohio, in the Parkersburg river district. The weather continued mild throughout the month, the average temperature, 43.2°, was the second highest of January State record. Unusually high temperatures for the season prevailed on the 8th, 14th, and 24th, the highest temperatures of the month, ranging from 62° to 78°, occurred at practically all stations on the 8th. The absolute minimum temperature for the month, 11°, was the highest of January State record. The snowfall was unusually light and unimportant. Winter grains made satisfactory progress and were in fair to good condition during most of the month, although many fields were much too wet for plowing. At the close of the month, meadows and pastures were green in many districts, and early fruit buds were beginning to swell.

TEMPERATURE

The average temperature for the northeastern panhandle division was 40.1°, or 9.1° above normal; for the northern division, 43.1°, or 10.5° above normal; for the southern division, 44.6°, 10.6° above normal; and for the State, 43.2°, or 10.4° above normal. The highest monthly mean temperature was 47.2° at Gary and London, and the lowest was 37.2° at Terra Alta. The highest temperature was 78° at Parsons on the 8th, and London on the 24th; and the lowest, 11° at Romney on the 5th, and McNeill on the 6th, making the monthly range for the State 67°. The greatest daily range was 47° at Creston on the 27th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 5.72 inches, or 2.51 inches above normal; for the northern division, 9.25 inches, or 5.22 inches above normal; for the southern division, 8.55 inches, or 4.85 inches above normal; and for the State, 8.50 inches, or 4.77 inches above normal. The greatest monthly amounts of precipitation were received in the central and western counties, and the least in the northeastern panhandle districts. The greatest monthly precipitation was 12.07 inches at Huntington, and the least, 4.04 inches at McNeill. The average snowfall, 0.6 inch, was 7.3 inches below normal. The greatest monthly snowfall was 8.0 inches at Wellsburg. The greatest amount of precipitation in any 24 consecutive hours was 2.10 inches at Dam 26, Ohio River, on the 18th.

RIVER

The Ohio River was above flood stage from January 18th to February 2d, inclusive. The following crest stages in feet and tenths, were noted: Wheeling (Dam 12), 48.7; Marietta, 55.0; Parkersburg, 55.4; Ravenswood (Dam 22), 60.5; Pt. Pleasant, 62.7; Huntington, 69.0. This was the greatest flood of record at Huntington.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 1st, 4; 5th, 1; 7th, 1: 8th, 3, 9th, 1; 10th, 1: 12th, 1; 13th, 1. 18th, 1; 19th, 2; 22d, 2: 23d, 2: 24th, 1; 25th, 1; 27th, 1; 28th, 2: 29th, 1: 30th, 2.

Sleet: 2d, 5; 3d, 1; 17th, 1; 18th, 1; 20th, 4: 21st, 1: 22d, 1; 23d, 11; 24th, 1; 25th, 1: 28th, 1: 29th, 3; 30th, 1.

Thunderstorms; 24th, 6.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for January 1937

VOL. XLV PARKERSBURG, W. VA., FEBRUARY 1937 No. 2

THE LIBRARY OF THE APR 1937 UNIVERSITY OF ILLINOIS

GENERAL SUMMARY

Unusually mild weather prevailed during most of the month, with temperature extremes well within previous February records. Only two or three cold spells occurred, lasting from the 2d to the 6th, 17th and 18th, and from the 25th to the close of the month, but were moderate for the season, as only two stations reported temperatures below zero. The highest temperatures for the month occurred, as a rule, on the 8th, 9th, and 13th. Precipitation averaged somewhat above the normal, and was mostly in the form of rain. The greatest monthly amounts were received in the central and mountain counties, and the least in the extreme northern and northeastern panhandle districts. There was mostly light snow in the western districts, but rather heavy amounts in some of the mountain sections, making the average snowfall for the month slightly above the normal. The soil was much too wet for plowing, but weather conditions were generally favorable for other out-door activities. Fruit orchards have not been materially injured by freezing, but at the close of the month fruit buds were beginning to swell. Winter grains were in fair to good condition, and pastures and meadows were somewhat green in many districts. Stock remained in the open during most of the month.

TEMPERATURE

The average temperature for the northeastern panhandle division was 33.1°, or 0.2° above normal; for the northern division, 34.4°, or 1.0° above normal; for the southern division, 35.5°, or 0.1° above normal; and for the State, 34.6°, or 1.5° above normal. The highest monthly mean temperature was 38.5° at Hastings, and the lowest, 26.6° at Terra Alta. The highest temperature was 80° at London on the 9th, and the lowest, 3° below zero at McNeill on the 17th, making the monthly range for the State 83°. The greatest daily range was 54° at Charleston on the 8th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 3.14 inches, or 0.70 inch above normal; for the northern division, 3.37 inches, or 0.16 inch above normal; for the southern division, 3.35 inches, or 0.15 inch above normal; and for the State, 3.33 inches, or 0.22 inch above normal. Most of the precipitation was received on the 8-9th, 15-16th, and 21st-22d. The greatest monthly precipitation was 5.96 inches at Terra Alta, and the least, 1.20 inches at Upper Tract. The greatest amount in any 24 consecutive hours was 2.70 inches at Creston on the 7-8th. The average monthly snowfall, 9.1 inches, was 0.5 inch above normal. The greatest monthly snowfall was 43.0 inches at Davis. The average number of days with .01 inch or more of precipitation was 12.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 7th, 3; 9th, 1; 12th, 1; 15th, 1; 17th, 1; 19th, 2; 21st, 2.

Hail, light: 14th, 1; 21st, 9; 22d, 4.

Halos, lunar: 15th, 1; 17th, 1; 19th, 1.

Sleet: 7th, 1; 9th, 1; 14th, 1; 18th, 1; 21st, 4; 22d, 1.

Thunderstorms: 7th, 6; 8th, 15; 9th, 2; 21st, 22; 22d, 5.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for February 1937

VOL. XLV PARKERSBURG, W. VA., MARCH 1937 No. 3

GENERAL SUMMARY

March was a dry month. All stations throughout the State showed deficiencies in rainfall. It was the fifth driest March of record. Precipitation occurred frequently, but the amounts were mostly light and unimportant. The greatest amounts were received in the northern mountain section and the least in the Ohio river counties. The month was also cold, the deficiencies reported being quite general and equally distributed over the State. It was unseasonably cold the first few days of the month with a low reading of 3° below zero in the mountain section. The warm weather occurred from the 20th to the 23d at most places over the State. It was the coldest March since 1916. The cold weather held back fruit buds in most sections of the State, but near the close of the month they developed quite rapidly. Very little work done in the way of planting and sowing except near the end of the month. Unusually heavy snowfall in the central or mountain counties. At the close of the month the season was a week to ten days late.

TEMPERATURE

The average temperature for the northeastern panhandle division was 38.2°, or 3.0° below normal; for the northern division, 37.5°, or 4.3° below normal; for the southern division, 39.7°, or 3.9° below normal; and for the State, 38.5°, or 3.9° below normal. The highest monthly mean temperature was 43.0° at Huntington, and the lowest, 28.6° at Terra Alta. The highest temperature was 80° at London on the 20th, and the lowest, 3° below zero at Alpena on the 1st, making the monthly range 83° for the State. The greatest daily range was 47° at Robertsburg on the 20th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 1.70 inches, or 1.39 inches below normal; for the northern division, 2.42 inches, or 1.65 inches below normal; for the southern division, 1.72 inches, or 2.41 inches below normal; and for the State, 2.05 inches, or 1.88 inches below normal. Most of the precipitation was received on the 8-10th, 13-18th, and 24-27th. The greatest monthly precipitation was 4.23 inches at Parsons, and the least, 0.58 of an inch at Dam 25 Ohio River. The greatest amount in any 24 consecutive hours was 1.27 inches on the 15th at Cairo. The average monthly snowfall, 11.0 inches, was about twice the normal. The greatest monthly snowfall was 59.0 inches at Davis. The average number of days with .01 inch or more of precipitation was 10.

MISCELLANEOUS PHENOMENA
(Dates and number of stations reporting)

Dust, moderate: 20th, 1; 24th, 2; 25th, 5.
Earthquake: 9th, 2.

MISCELLANEOUS PHENOMENA (Continued)

Fogs, dense: 6th, 1; 10th, 1; 14th, 1; 15th, 1; 16th, 1; 18th, 1; 19th, 2; 21st, 1; 22d, 2; 23d, 1.
Hail, light: 19th, 1; 20th, 3; 24th, 3; 25th, 6; 26th. 1.
heavy: 20th, 3; 25th, 1.
Halo, lunar: 22d, 1.
Sleet: 13th, 2; 14th, 4.
Thunderstorms: 12th, 1; 20th, 15; 21st, 2; 23d, 1; 24th, 6; 25th, 10.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for March 1937

VOL. XLV PARKERSBURG, W. VA., APRIL 1937 No. 4

GENERAL SUMMARY

April was about normal in temperature and considerably wetter than usual. The first half of the month was cold, with the minimum temperatures down to or below the freezing point on nearly every night. The highest and lowest temperatures were well within previous April records. Snowfall was unimportant. Farm work was much retarded by frequent rains, which were heavy over the northeastern part of the State during the last week. At the close of the month pastures and meadows were in good condition.

TEMPERATURE

The average temperature for the northeastern panhandle division was 49.4°, or 0.°5 below normal; for the northern division, 50.8°, or 0.7° below normal; for the southern division, 53.0°, or practically normal; and for the State, 51.4°, or 0.3° below normal. The highest monthly mean temperature was 56.4° at Huntington and the lowest, 40.2° at Hopemont. The highest temperature was 91° at Romney on the 18th, and the lowest was 18° at Rainelle on the 1st, making the monthly range for the State 73°.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 5.84 inches, or 2.78 inches above normal; for the northern division, 4.32 inches, or 0.65 inch above normal; for the southern division, 3.16 inches, or 0.32 inch below normal; and for the State, 4.09 inches, or 0.57 inch above normal. The greatest monthly precipitation was 8.76 inches at Harpers Ferry and the least, 1.19 inches at Dam 19, Ohio River. The greatest amount in any 24 consecutive hours was 4.20 inches at Wardensville on the 25-26th. The average monthly snowfall, 0.2 inch was 1.7 inches less than normal. The average number of days with .01 inch or more of precipitation was 12.

RIVER

Heavy rains over the Allegheny and Monongahela watersheds on the 25-26th caused a moderate flood in the Ohio River. A crest stage of 45.9 feet was reached at Wheeling, on the 28th, 40 feet at Marietta, Ohio, and 39.2 feet at Parkersburg on the 29th. For the lower part of district, Dam 25 reported a crest of 45.7 feet, and Point Pleasant, 41.7 feet on the 30th.

HAIL

Light hail occurred in sections of the following counties on dates given: Cabell, Gilmer, and Kanawha on the 15th; Cabell, Brooke, and Lewis on the 27th.

Moderately heavy hail fell in Lewis and Roane counties on the 15th, and Berkeley county on the 25th. Little damage resulted.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 19th, (2); 27th, (1); 29th, (2).

Halos, lunar: 3d, (1); 21st, (1).

Sleet: 27th, (1).

Thunderstorms: 1st, (1); 13th, (2); 14th, (4); 15th, (10); 16th, (1); 17th, (1); 18th, (3); 19th, (3); 25th, (1).

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for April 1937

VOL. XLV PARKERSBURG, W. VA., MAY 1937 No. 5

GENERAL SUMMARY

May averaged slightly below the normal in temperature and precipitation. There were but two periods of warm weather, 1st to 4th, 24th to 31st, while the temperature was below the normal for about two-thirds of the month. Light to killing frosts occurred in the interior, during the middle portion of the month. The damage from frost was light and limited to the mountain regions. The rainfall was received over the State in two well defined divisions, the northern half was heavy in places, and above normal, while the southern half, with few exceptions, was below the normal. Growth was rapid during the last half of the month. At the close of the month pastures and meadows were in excellent condition, and small fruit was plentiful.

TEMPERATURE

The average temperature for the northeastern panhandle division was 60.9°, or 0.°5 above normal; for the northern division, 61.0°, or 0.2° below normal; for the southern division, 62.0°, or 0 2° below normal; and for the State, 61.4°, or 0.3° below normal. The highest monthly mean temperature was 65.8° at Hastings, and the lowest, 53.1° at Terra Alta. The highest temperature was 97° at Hastings on the 31st, and the lowest was 28° at Bayard, Terra Alta and Rainelle on the 11th, and Brandywine on the 1st, making the monthly range for the State 69°. The greatest daily range was 52° at Brownsville on the 1st.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 2.83 inches, or 0.86 inch below normal; for the northern division, 4.65 inches, or 0.44 inch above normal; for the southern division, 2.59 inches, or 1.34 inches below normal; and for the State, 3.58 inches, or 0.34 inch below normal. Most of the precipitation was received on the 4-7th, 12-16th, and 26-27th, with the greatest amounts being measured on the 26-27th. The greatest monthly precipitation was 7.17 inches at Bens Run, and the least, 0.94 inch at Bluefield. The greatest amount in any 24 consecutive hours was 2.25 inches at Thomas on the 28th. The average number of days with .01 inch or more of precipitation was 12.

HAIL

Light hail occurred in sections of the following counties on dates given: Hancock, Pocahontas, 17th; Pleasants, 27th; Randolph, 18th; Wirt, 16th.

Moderately heavy hail fell in and near Point Pleasant, Mason County, on the 26th, and at Williamson, Mingo County, on the 27th. The stones were from one fourth to one half inch in size, and covered the ground to a depth of several inches.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 6th, 2; 7th, 4; 8th, 2; 10th, 1; 11th, 5; 14th, 15th, 16th, 17th, 1 each; 20th, 2; 21st, 1; 23d, 1; 24th, 9; 25th, 4; 26th, 1; 29th, 6; 30th, 31st, 5 each.

Thunderstorms: 5th, 5; 6th, 1; 8th, 1; 13th, 1; 14th, 4; 15th, 1; 16th, 5; 17th, 4; 22d, 12; 23d, 7; 26th, 12; 27th, 15; 28th, 12.

ERRATUM.– April, mean temperature at Elkins, should read 48.6°, departure –0.2°.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for May 1937

VOL. XLV PARKERSBURG, W. VA., JUNE 1937 No. 6

GENERAL SUMMARY

June was moderately warm and considerably wetter than usual, with the rainfall generally favorably distributed throughout the month and over the State. Temperatures were well above the normal over the northeastern panhandle, but only moderately above over the remainder of the State. Rainfall was in excess of the normal at all stations, except in the central part of the State. Torrential rain, attending an electrical windstorm, fell over Gilmer, Lewis and Wood counties on the 21st-22d, causing a flood at Glenville, of 27.8 feet, the third highest of record. The rains and wind destroyed crops, gardens, grain, livestock and property. Four lives were lost by drowning. Many homes were flooded, and several washed from foundations. At the close of the month all crops were in excellent condition. Wheat cutting was generally in progress.—*H. C. D.*

TEMPERATURE

The average temperature for the northeastern panhandle division was 70.6°, or 3.1° above normal; for the northern division, 70.6°, or 1.6° above normal; for the southern division, 71.2°, or 1.1° above normal; and for the State, 70.8°, or 1.2° above normal. The highest monthly mean was 75.0° at Bancroft and Huntington and the lowest was 62.4° at Terra Alta. The highest temperature was 101° at Martinsburg on the 1st and the lowest was 40° at Bayard on the 9th and 24th, making the monthly range 61°. The greatest daily range was 44° at McNeill on the 9th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 4.25 inches, or 0.35 inch above normal; for the northern division, 5.80 inches, or 1.37 inches above normal; for the southern division, 4.31 inches, or 0.04 inch below normal; and for the State, 5.03 inches, or 0.69 inch above normal. The greatest monthly precipitation was 10.13 inches at Pickens and the least, 1.25 inches at White Sulphur Springs. The greatest amount in any 24 consecutive hours was 3.86 inches at Glenville on the 22d. The average number of days with .01 inch or more of precipitation was 13.

HAIL

Hail fell on the 14th in portions of Berkeley, Hampshire, Harrison, Pendleton and Randolph Counties and was moderate in the vicinity of Shinnstown and heavy in the vicinity of Romney, where damage to gardens and fruit was considerable.

MISCELLANEOUS PHENOMENA
(Dates and number of stations reporting)

Thunderstorms: Reported somewhere in the State each day except the 12th, 13th, 23d and 24th, being most prevalent on the 9th, 14th, 17th, 21st and 27th.

MISCELLANEOUS PHENOMENA (Continued)

Fogs, dense: 3d, 1; 4th, 3; 8th, 8; 11th, 2; 12th, 9; 13th, 5; 14th, 1; 15th, 1; 16th, 2; 17th, 1; 19th, 2; 20th, 4; 21st, 2; 22d, 1; 23d, 4; 24th, 4; 25th, 2; 26th, 5; 27th, 3; 29th, 2.

Solar halo: 13th, 1.

Lunar corona: 20th, 1.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for June 1937

VOL. XLV PARKERSBURG, W. VA., JULY 1937 No. 7

GENERAL SUMMARY

This was the coolest July since 1927, although the northeastern panhandle averaged above normal. Generally the highest temperatures were in the 90's, and occurred on the 10th, also on other dates near the middle of the month. These temperatures were offset by cool nights and by cool periods at the opening and close of the month.

Rainfall was less than normal and was spotty over the southern section causing drought conditions in scattered localities, and more than normal amounts over the south-central district. Only about one half the normal amount of rain fell over the panhandle and over the southwestern district. Showers occurred generally over the state the first week, and the 26th, but most of the rain occurred in showers from the 10th to 20th. With abundant sunshine, the month was generally favorable for crop growth, with rain being needed over the panhandle, and locally over the southern district.

On the 10th, a heavy rainstorm occurred east of Wheeling causing a flood in the Middle and Little Wheeling Creeks, resulting in considerable damage to houses, outbuildings, cars, and trailers located in the valleys. Another rainstorm occurred at Wheeling on the 17th but little or no damage was reported.—*W.A.B.*

TEMPERATURE

The average temperature for the northeastern panhandle division was 72.8°, or 0.5° above normal; for the northern division, 72.4°, or 0.8° below normal; for the southern division, 72.4°, or 1.2° below normal; and for the State, 72.4°, or 0.7° below normal. The highest monthly mean temperature was 78.4° at Martinsburg and the lowest, 66.0° at Pickens. The highest temperature was 101° at Martinsburg on the 16th and the lowest was 37° at Bayard on the 28th, making the monthly range for the State, 64°. The greatest daily range was 50° at McNeill on the 28th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 2.11 inches, or 1.63 inches below normal; for the northern division, 3.79 inches, or 0.89 inch below normal; for the southern division, 4.79 inches, or 0.26 inch above normal; and for the State, 3.96 inches, or 0.61 inch below normal. The greatest monthly precipitation was 7.96 inches at Richwood and the least, 1.07 inches at Kearneysville. The greatest amount in any 24 consecutive hours was 3.35 inches at Point Pleasant on the 12-13th. The average number of days with .01 inch or more of precipitation was 12, or 2 more than normal.

LIGHT HAIL

Light hail fell in sections of Brooks and Roane Counties on the 17th and Randolph County on the 31st.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

THUNDERSTORMS: Reported somewhere in the State each day except the 7th, 19th, 21st, and 27-30th, being most prevalant on the 10th, 11th, 12th, 13th, 14th, 16th, 17th, 25th and 31st.

FOGS, DENSE: 1st, 3; 2d, 2; 3d, 1; 4th, 1; 5th, 1; 6th, 7; 7th, 4; 8th, 2; 9th, 2; 19th, 5; 20th, 2; 21st, 2; 22d, 7; 23d, 2; 24th, 2; 25th, 2; 26th, 1; 27th, 4; 28th, 5; 29th, 3; 30th, 2; 31st, 2.

SOLAR HALO: 31st, 1.

HIGH WINDS: Berkeley and Hardy Counties on the 11th and 12th.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for July 1937

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. XLV PARKERSBURG, W. VA., AUGUST 1937 No. 8

GENERAL SUMMARY

The month was decidedly warm, being the third warmest August of State record. The month was characterized by nearly continuously warm weather with only two stations reporting below normal temperatures. This was the third consecutive warm month. The rainfall averaged considerably above the normal for all sections of the State, except the northern panhandle and along the Ohio river in the southern part. The northeastern panhandle section received the heaviest amount, the average being 8.42 inches. The excessive amounts ranged from two inches above normal at Brandywine, Pendleton county, to eleven inches above at Wardensville, Hardy county. The latter station reported a 24 hour rainfall of 4.78 inches, occurring on the 23d. The rain was beneficial to vegetation generally, though farm work was delayed somewhat. The excessive wet weather brought some rotting of potatoes in in the northeastern panhandle area. Abundance of apples, peaches and grapes was in prospect. Pastures and meadows were excellent at the close of the month.—*H.C.D.*

TEMPERATURE

The average temperature for the northeastern panhandle division was 74.0°, or 3.4° above normal; for the northern division, 74.5°, or 3.1° above normal; for the southern division, 74.3°, or 2.0° above normal; and for the State, 74.4°, or 2.6° above normal. The highest temperature 101° occurred at Martinsburg on the 19th, and the lowest 40° at Bayard on the 2d, making the monthly range for the State 61°. The greatest daily range was 47° at McNeill on the 17th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 8.42 inches, or 4.68 inches above normal; for the northern division, 5.11 inches, or 0.91 inch above normal; for the southern division, 5.90 inches, or 1.85 inches above normal; and for the State, 5.83 inches, or 1.71 inches above normal. The greater portion of the precipitation was received on the 5th to 13th, 19th to 27th, and the 30th, 31st. The greatest monthly amount was 14.44 inches at Wardensville, and the least 1.06 inches at Ravenswood. The average number of days with .01 inch or more of precipitation was 13.

LIGHT HAIL

Light hail fell in the district north of Wellsburg, on the 10th, but no damage was reported.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for August 1937

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. XLV PARKERSBURG, W. VA., SEPTEMBER 1937 No. 9

GENERAL SUMMARY

September was considerably cooler and slightly drier than the average, being the coolest since 1928 and the sixth coolest in the past 47 years. The month opened unseasonably warm, but after the 4th the temperature averaged from normal to considerably below during the remainder of the month. Cool weather prevailed on the 17-18th, with below freezing temperatures. An extreme low reading of 23° was noted at Bayard on the 18th. Heavy to killing frosts occurred in the northern half of the State, except along the Ohio river. This is considerably earlier than the average date of first killing frost in autumn. Not much damage resulted due to the early maturity of most crops. Rainfall occurred mostly from the 4th to 7th, and light scattered showers during remainder of the month. Many stations had from 15 to 20 consecutive days without precipitation, and many small streams and springs became dry. The number of clear days and resulting percentage of sunshine were appreciably above the normal. Most of the month was favorable for late summer crops, corn matured over most of the State, but some late corn was caught by frosts.—*H.C.D.*

TEMPERATURE

The average temperature for the northeastern panhandle division was 62.1°, or 2.9° below normal; for the northern division, 63.1°, or 3.4° below normal; for the southern division, 63.9°, or 3.0° below normal; and for the State, 63.2°, or 3.2° below normal. The highest monthly mean temperature was 67.8° at Huntington, and the lowest, 54.8° at Terra Alta. The highest temperature was 98° at Romney on the 3d, and Wellsburg on the 2d; and the lowest was 23° at Bayard on the 18th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 2.21 inches, or 0.56 inch below normal; for the northern division, 2.54 inches, or 0.52 inch below normal; for the southern division, 1.63 inches, or 1.12 inches below normal; and for the State, 2.18 inches, or 0.73 inch below normal. The greatest monthly precipitation was 4.95 inches at Weston, and the least 0.45 of an inch at Piedmont. The greatest amount in any 24 consecutive hours was 3.34 inches at Brownsville on the 5th.

MISCELLANEOUS PHENOMENA
(Dates and number of stations reporting)

Fogs, dense: 1st, 2; 2d, 2; 3d, 3; 4th, 1; 7th, 1; 8th, 1; 10th, 6; 12th, 8; 13th, 3; 14th, 3; 15th, 4; 16th, 5; 17th, 1; 18th, 8; 19th, 3; 20th, 6; 21st, 6; 22d, 10; 23d, 8; 24th, 6; 25th, 8; 26th, 1; 27th, 3; 28th, 2; 29th, 10; 30th, 10.

MISCELLANEOUS PHENOMENA (Continued)

Frosts, heavy: 18th, 4; 20th, 2; 21st, 2.

killing: 15th, 1; 17th, 1; 18th, 8; 19th, 1; 20th, 5; 21st, 4; 27th, 1; 28th, 1; 29th, 1; 30th, 1.

Thunderstorms: 2d, 1; 3d, 3; 4th, 3; 5th, 7; 6th, 1; 8th, 1; 9th, 1.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for September 1937

VOL. XLV PARKERSBURG, W. VA., OCTOBER 1937 No. 10

GENERAL SUMMARY

The outstanding feature of the weather during October was he heavy precipitation. Normally the lightest rainfall month of the year, yet this month's average was the greatest since January. For the State as a whole the average precipitation of 6.99 inches has been exceeded but once since State-wide records began, that, in 1925 when the average was 7.30 inches. Rain fell on almost every day of the month at some places in n the State. Every station reported amounts of one inch or nore in a 24 hour period, while at seven stations amounts in excess of three inches occurred. The average snowfall, 1.2 nches, was also exceptionally heavy, only three other years exceeding the past October record. As a rule the snowfall for October is unimportant. Snow was quite general and heavy n mountain districts on the 22d-24th. Flat Top reported 9 nches and Pickens, 12 inches at an elevation of 3,500 feet. The heavy precipitation caused floods in the Potomac, Monongahela, Little Kanawha and Great Kanawha Rivers. Not much damage resulted. The average number of rainy days, 16, equalled the record made in 1925. The month was exceptionally cloudy and cold, every station having below normal mean temperatures. Killing frosts occurred over the southern division generally on the 15th. At the close of the month fall work was well advanced, corn mostly husked, and wheat in good condition.—*H.C.D.*

TEMPERATURE

The average temperature for the northeastern panhandle division was 50.8°, or 2.5° below normal; for the northern division, 51.6°, or 2.7° below normal; for the southern division, 51.6°, or 3 7° below normal; and for the State, 51.6°, or 3.0° below normal. The highest monthly mean temperature was 55.8° at Huntington and Point Pleasant, and the lowest, 45.9° at Pickens. The highest temperature was 91° at Grafton on the 2d and 3d, and the lowest, 11° at Bayard on the 25th, making the monthly range for the State 80°. The greatest daily range was 47° at Cairo on the 4th, and at Hinton on the 30th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 8.96 inches, or 6.23 inches above normal; for the northern division, 6.89 inches, or 3.88 inches above normal; for the southern division, 6.44 inches, or 3.63 inches above normal; and for the State, 6.99 inches, or 4.09 inches above normal. The greater portion of the precipitation was received from the 3d-5th, 9-14th, 18-24th, and the 27-28th, the greatest amounts being measured on the 4-5th and 27-28th. Light snow flurries occurred in the mountain sections on the 9th, and general snows on the 22d-24th. The greatest monthly precipitation was 11.25 inches at Bayard, and the least 3.55 inches at New Cumberland. The greatest amount in any 24 consecutive hours was 3.68 inches at Bayard on the 28th.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 1st, 9; 2d, 8; 5th, 1; 6th, 1; 8th, 4; 9th, 1; 11th, 1; 12th, 1; 13th, 1; 14th, 5; 15th, 4; 16th, 2; 17th, 1; 19th, 1; 27th, 1; 29th, 4; 30th, 1; 31st, 2.

Thunderstorms: 5th, 2; 6th, 3; 7th, 2; 20th, 1; 24th, 1; 26th, 8; 27th, 1.

Halos: Lunar, 16th, 17th, 18th and 19th, 1 each: Solar, 16th, 1.

Hail: At New Cumberland during thunderstorms on the 20th and 26th: no damage.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for October 1937

VOL. XLV PARKERSBURG, W. VA., NOVEMBER 1937 No. 11

GENERAL SUMMARY

The precipitation averaged about one-half of the normal, being the driest November since the drought year of 1930. While the precipitation was insufficient to reach the smaller rivers, soil conditions were excellent for outdoor work. The rainy periods of the month were, 2-3d, 5-6th, 12th-22d, 26-29th. The greatest amounts were received in the east-central part of the State, and the least along the Ohio river in Jackson, Mason and Wood counties. The snowfall, however, was almost twice the normal, occurring generally on the 19th-21st. The following heavy monthly amounts were noted: 23 inches at Pickens, 16.5 inches at Davis, and 12 inches at Terra Alta. Most of the snow melted before the close of the month. The temperature averaged below normal at all stations. The warm periods were, 1st-2d, and the 26-28th, while the cold part of the month occurred from the 16th to the 25th. There was ample sunshine, the number of clear days for the State being near the normal. High winds occurred generally along the western counties on the 28th, no damage being reported. Winter grains were well protected by the snow cover during the cold periods of the month.—*H. C. D.*

TEMPERATURE

The average temperature for the northeastern panhandle division was 41.3°, or 1.5° below normal; for the northern division, 40.7°, or 2.4° below normal; for the southern division, 41.1°, or 2 9° below normal; and for the State, 41.0°, or 2.2° below normal. The highest monthly mean temperature was 44.6° at Brownsville, and the lowest 36.6° at Pickens. The highest temperature was 78° at Madison on the 2d and Martinsburg, Wardensville and Hinton on the 8th, and the lowest was −3° at Rainelle on the 23d, making the monthly range for the State 81°. The greatest daily range was 51° at McNeill and Rainelle on the 24th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 1.51 inches, or 0.63 inch below normal; for the northern division, 1.62 inches, or 1.30 inches below normal; for the southern division, 1.48 inches, or 1.26 inches below normal; and for the State, 1.56 inches, or 1.18 inches below normal. The greatest monthly precipitation was 4.09 inches at Pickens and the least, 0.73 inch at Parsons. The average snowfall was 3.6 inches, or 1.4 inches above normal. The greatest monthly snowfall was 23.0 inches at Pickens. The greatest amount of precipitation in any 24 consecutive hours was 1.75 inches at Martinsburg on the 13th.

ERRATA

September 1937: Mannington, total precipitation, 2.13; departure, —1.26. Pickens, total precipitation, 3.16; departure, —0.94. Stony River Dam, total precipitation, 2.72; departure, —0.06. Weston, lowest temperature, 34 on the 27th.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 1st, 2; 3d, 3; 6th, 13th and 14th, 1 each; 24th, 2; 25th, 1; 26th, 5; 27th, 11; 28th, 8; 30th, 1.

Halos: Lunar, 10th, 1; 19th, 1; Solar, 7th, 8th, 11th and 30th, 1 each.

Thunderstorms: 28th, 15.

Hail: At New Cumberland during thunderstorm on 28th; light.

Sleet: 12th, 15th, 16th, and 19th, 1 each.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for November 1937

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. XLV PARKERSBURG, W. VA., DECEMBER 1937 No. 12

GENERAL SUMMARY

The first half of the month was decidedly cold, and the last half warm. The first 14 days were the coldest experienced since the record-breaking year of 1917; daily mean temperatures averaged from 13° to 20° below normal. The second half of the month was continuously above the normal.

The precipitation was deficient in almost all sections of the State. The periods of greatest amounts received were from the 5th to 8th, and 13th to 28th. During the latter period, moderately heavy rains on the 16th to 18th caused floods in the northern panhandle area and near floods elsewhere on the Ohio on the 19-20th. Snowfall for the month averaged an inch above the normal, ranging from a trace in the northeastern panhandle section to 19 inches in the mountain region. The ground was covered generally by snow during the first half of the month, protecting the winter grains during the cold period. During the cold period from the 10th to 16th, the Ohio river and tributaries were frozen to an average depth of two inches. —*H. C. D.*

TEMPERATURE

The average temperature for the northeastern panhandle division was 31.9°, or 1.3° below normal; for the northern division, 31.4°, or 3.8° below normal; for the southern division, 33.2°, or 2.0° below normal; and for the State, 32.2°, or 2.3° below normal. The highest mean temperature, 35.7°, occurred at Huntington, and the lowest, 26.9° at Terra Alta. The highest temperature was 66° at Pickens and Wardensville on the 17th, and the lowest 9° below zero at Benson and Bayard on the 12th. The greatest daily range was 46° at Rainelle on the 3d.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 1.50 inches, or 1.01 inches below normal; for the northern division, 3.13 inches, or 0.44 inch below normal; for the southern division, 2.39 inches, or 0.92 inch below normal; and for the State, 2.66 inches, or 0.68 inch below normal. The greatest monthly precipitation, 5.15 inches, occurred at Sutton, and the least, 0.35 inch at White Sulphur Springs. The greatest amount in any 24 consecutive hours was 1.50 inches, on the 18th, at Horner. The greatest monthly snowfall was 19.0 inches at Pickens.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 1st, 2; 5th, 1; 14th, 3; 15th, 5; 16th, 8; 17th, 6; 18th, 19th, 20th, 23d, 24th, 27th and 28th, 1 each; 29th and 30th, 2 each; 31st, 1.

Halos, solar: 3d, 1; 12th, 1.

Sleet: 5th, 1; 13th, 7; 14th, 7; 15th, 13; 17th, 2; 19th and 27th, 1 each. *Glaze:* 13th, 1; 14th, 2.

ERRATA

November, 1937: Mean temperature: Benson, 39.4°; Fairmont, 41.2°; northern division, 40.5°; State, 40.9°.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for December 1937

Vol. XLV   Parkersburg, W. Va., Year 1937   No. 13

GENERAL SUMMARY

Compared to previous State averages the year 1937 was exactly normal in temperature. The winter months were above the average, being exceptionally warm for the season. Spring months were cool, while the summer averaged above the normal, and the remainder of the year was below the average.

Precipitation was considerably above the normal, and was heavy during the winter months, especially during January. October was an exceptionally wet month. The snowfall was below the normal.

During the period of growth the rainfall was ample. The cool spring months were unfavorable for germination and growth, while during June and July conditions were favorable for all crops. The season of growth extended from April 12th, generally, to the middle of October, being somewhat longer than usual.

Due to almost continuous rain from January 10th to the 25th, and at times unusually heavy, a serious and destructive flood occurred along the Ohio river, the greatest of record below Point Pleasant and the second greatest of record from Bens Run to Point Pleasant.

Cloudiness was considerably in excess of average. The sunshine at Parkersburg and Elkins averaged 51 and 49 per cent, respectively, or slightly above normal.

The wind movement at Parkersburg was 55,045 miles, and at Elkins 53,831 miles.—*H. C. D.*

THE WEATHER BY MONTHS

JANUARY.—Wettest January on record. Practically continuous rains, some of the time unusually heavy, during the period 10th to 25th caused a serious and destructive flood on the Ohio, the greatest of record below Point Pleasant and the second greatest of record from Bens Run to Point Pleasant. Snowfall was unusually light. The weather was mild; mean temperature was second highest of record for January.

FEBRUARY.—Unusually mild weather continued, with precipitation somewhat above normal and mostly in the form of rain. Fruit buds were beginning to swell at the close of the month. The Ohio River returned to normal stage at close of opening week.

MARCH.—Cold and dry. Cold at beginning of month held back fruit buds, but near close of the month they developed quite rapidly. It was the fifth driest March of record. There was unusualy heavy snowfall in the central or mountain Counties.

APRIL.—About normal in temperature and somewhat wetter than usual. First half was cold; second half warm. Snowfall was unimportant. Farm work retarded by frequent rains. Ohio River slightly above flood stage during closing days of month.

MAY.—Temperature and precipitation slightly below normal. Frost formed over interior during middle portion of month, but damage was light and limited to mountain regions. Vegetation had rapid growth during second half of month.

JUNE.—Moderately warm and considerable wetter than usual. Torrential rain on the 21st-22d caused a flood in the Little Kanawha at Glenville, the third highest of record at that station. Four lives were lost by drowning, while much property damage resulted. All crops were in excellent condition.

JULY.—Comparatively cool. Rainfall was somewhat deficient and was rather spotty, causing drought conditions in scattered localities. Crops continued good, except in the northeastern panhandle and locally in the southern division. Heavy rains on the 10th caused a flood in the Middle and Little Wheeling Creeks, resulting in considerable property damage.

AUGUST.—Decidedly warm; third warmest August of record. Rainfall was well above normal, except in the northern panhandle and southern Ohio River sections. Crops were generally good, although excessive rains brought some rot to potatoes in northeastern panhandle area and delayed farm work.

SEPTEMBER.—Considerably cooler and slightly drier than average. Heavy to killing frosts occurred in the northern half of the State, except along the Ohio River, on the 18th. Harvesting was about completed.

OCTOBER.—Unusually heavy precipitation. Snow was quite general and heavy in the mountain districts on the 22d-24th. Heavy precipitation caused flood in the Potomac, Monongahela, Little Kanawha and Great Kanawha Rivers during closing days of month, but without material damage. Temperatures were low, and killing frosts occurred over the southern division on the 15th. Farm work was well advanced.

NOVEMBER.—Dry, with temperature slightly below normal. Precipitation was about one-half of the normal; snowfall, however, was almost twice the normal, with greatest amount, 23 inches at Pickens. Winter grains were well protected by the snow cover during the cold periods. High winds on 28th caused no material damage.

DECEMBER.—Generally cold and dry. First half of month was coldest of record since 1917, with daily deficiency ranging from 13 to 20 degrees. During this period the Ohio River and tributaries were frozen to a depth of two inches. Second half was continuously somewhat above normal. Precipitation was deficient in most sections, but moderately heavy rains on the 16th to 18th caused slight floods in the Ohio as far south as the confluence with the Muskingum. Snowfall was slightly above normal, monthly totals being as high as 19 inches in the mountains. Winter grains continued amply protected by snow cover during the extremely cold period.

VOL. XLVI PARKERSBURG, W. VA., JANUARY 1938 No. 1

GENERAL SUMMARY

The month was warmer and drier than normal, with more than the usual amount of sunshine. Temperatures were above normal except for frequent short cold periods. Exceptionally high temperatures prevailed on the 24th-25th. A temperature of zero or below occurred at only two stations.

The precipitation was below normal at all stations. The average of 1.48 inches below normal brought the deficiency for the two months, of winter season, to 2.16 inches. Although light, the precipitation was well distributed over the State and apparently sufficient for all purposes. The rivers were at pool stage most of the month. The average snowfall was less than one-half the normal, but covered the ground during the cold period of the month, affording protection to winter grains. High winds accompanying thunderstorms occurred generally on the 24th-25th.

Favorable weather permitted outdoor activities during greater part of the month. Winter grains made good growth and were in fair to good condition during most of the month. There was considerable winter plowing.—*H.C.D.*

TEMPERATURE

The average temperature for the northeastern panhandle division was 31.6°, or 0.9° above normal; for the northern division, 33.1°, or 0.7° above normal; for the southern division, 34.6°, or 0 6° above normal; and for the State, 33.5°, or 0.7° above normal. The highest monthly mean temperature was 38.4° at Brownsville, and the lowest was 26.9° at Terra Alta. The highest temperature was 77° at London on the 24th; and the lowest, 2° below zero at Flat Top on the 27th, making the monthly range for the State 79°. The greatest daily range was 54° at Rainelle on the 29th.

PRECIPITATION

The average precipitation for the northeastern panhandle division was 1.52 inches, or 1.66 inches below normal; for the northern division, 2.27 inches, or 1.72 inches below normal; for the southern division, 2.34 inches, or 1.33 inches below normal; and for the State, 2.22 inches, or 1.48 inches below normal. The greatest monthly amounts were received in the central and southern counties, and the least in the northern and northeastern panhandle divisions. The greatest monthly precipitation was 4.41 inches at Pickens, and the least 0.66 of an inch at Wardensville. The average snowfall was 4.2 inches, or 3.6 inches below normal. The greatest monthly snowfall was 19.0 inches at Davis. The greatest amount of precipitation in any 24 consecutive hours was 1.45 inches at Hastings on the 25th.

MISCELLANEOUS PHENOMENA

(Dates and number of stations reporting)

Fogs, dense: 1st, 1; 2d, 1; 7th, 3; 8th, 11th, 12th and 14th, 1 each; 15th, 2; 18th, 2; 19th, 5; 20th, 9; 21st, 8; 22d, 8; 24th, 1; 25th, 3.

Halos, solar: 3d, 1; 6th, 1; 16th, 2; 29th, 1.
lunar: 13th, 14th and 15th, 1 each.

Sleet: 8th, 1; 11th, 2; 12th, 3; 21st and 31st, 1 each.

Thunderstorms: 24th and 25th, 10 each.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates. †† Received too late to be included in means and summaries.

Reference letters appearing in the table indicate number of missing days; for example, a one day, b two days, etc.

Daily Precipitation for January 1938

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in next following measurement.
[2] Regular Weather Bureau station; precipitation is for 24-hour period, midnight to midnight. T. Trace, or less than 0.01 inch.

VOL. XLVI PARKERSBURG, W. VA., FEBRUARY 1938 NO. 2

GENERAL SUMMARY

The month, with an average temperature of 40.9° was the second warmest February of State record, or since 1890. The warmest of record occurred in 1932, when the average was 41.6°, and the highest daily reading of 86° was established. The lowest temperature reported was four degrees. In most years, a temperature of zero or below has been recorded. The precipitation averaged practically normal and was well distributed over the State and throughout the month, a single day, the 5th, being without precipitation. Amounts exceeding an inch occurred on the 11th and 20th, over scattered areas. The snowfall was about one third of the normal, occurring mostly during the last week. Greatest depth reported was 20 inches in upper Tygart Valley. Freezing rain and sleet storm glazed highways in mountain counties on the 27th and made travel extremely hazardous. In Tucker county much damage was done to telephone wires and poles. Hailstorm on the 21st in Gilmer, Harrison and Ritchie counties, caused damage to roofs and automobile tops. The Ohio river was at moderately high stage during the middle of the month. The weather during the month was favorable for winter grains, but unfavorable for outdoor activities.—*H.C.D.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 53 stations, was 40.9°, or 7.6° above the normal. The mean for the northeastern panhandle division was 38.6°; for the northern division, 40.4°; and for the southern division 41.9°. The highest monthly mean temperature was 45.6° at Williamson, and the lowest, 32.6° at Terra Alta. The highest temperature was 76° at London and Robertsburg on the 19th, and the lowest, 4° at Pickens, Terra Alta and Wellsburg on the 1st. The greatest daily range was 51° at Bayard on the 17th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 101 stations, was 3.01 inches, which is 0.10 inch below the normal. In the northeastern panhandle division the average was 1.76 inches; in the northern division, 3.37 inches; and in the southern division 2.87 inches. The greatest monthly precipitation was 5.85 inches at New Martinsville, and the least 0.64 inch at McNeill. The greatest amount in any 24 consecutive hours was 2.10 inches at New Martinsville on the 20th. The average monthly snowfall, 2.9 inches, was 5.6 inches below normal. Average number of days with .01 inch or more of precipitation was 12.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates.

Daily Precipitation for February 1938

VOL. XLVI PARKERSBURG, W. VA., MARCH 1938 NO. 3

GENERAL SUMMARY

With an average temperature of 48.3° the month was one of the warmest of State record, being nearly continuously warm. Moderately cold weather prevailed only on three or four days. The maximum temperature of 92° was within 2° of the record established in 1907. The lowest temperatures for the month were generally between three and ten degrees above zero, in the mountainous part of the State, elsewhere between ten and twenty degrees. Most were recorded on the 1st, with a few on the 4th and 11th. Maximum temperatures for the month were registered generally on the 22d, and were mostly in the eighties.

Precipitation fell in some section on practically every day of the month, and was well distributed over the State, except in the northeastern panhandle division. It was heavy in nearly all districts, only a few stations recorded less than the normal amount. Heavy rains, over an inch, occurred generally during the last three days of the month. Rivers were at moderate stages throughout the month. Only on four occasions, during a period of 44 years, has the March snowfall been less than that of this month, when 0.7 of an inch was recorded.

Conditions were generally favorably for fruit, which was coming into bloom, but farm work was much retarded by frequent rains. Winter wheat and pastures made good growth, and were in good condition at the close of the month.—*H.C.D.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 55 stations, was 48.3°, or 5.8° above the normal. The mean for the northeastern panhandle division was 45.6°; for the northern division, 47.8°; and for the southern division 49.5°. The highest monthly mean was 55.0° at Bancroft and the lowest, 39.9° at Terra Alta. The highest temperature was 92° at Institute on the 22d, and the lowest, 3° at Rainelle on the 1st. The greatest daily range was 55° at McNeill on the 19th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 101 stations, was 4 03 inches, which is 0.10 inch above the normal. In the northeastern panhandle division the average was 2.92 inches; in the northern division, 4.12 inches; and in the southern division 4.23 inches. The greatest monthly precipitation was 7.75 inches at Pickens, and the least, 1.65 inches at Wardensville. The greatest amount in any 24 consecutive hours was 2.44 inches at Wayne on the 22d. The average monthly snowfall was 0.7 inch, or 5.4 inches below normal. The greatest monthly snowfall was 8.0 inches at Stony River Dam. The average number of days with .01 inch or more of precipitation was 15.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates.

Daily Precipitation for March 1938

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

[1] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours.

* Precipitation included in next following measurement.

[2] Regular Weather Bureau station; precipitation is for 24-hour period, midnight to midnight.

T. Trace, or less than 0.01 inch.

VOL. XLVI PARKERSBURG, W. VA., APRIL 1938 No. 4

GENERAL SUMMARY

April averaged much warmer and slightly drier than usual. The last two decades were almost continuously above normal, culminating with a temperature of 92° on the 27th-28th. The warm dry weather caused a marked advance in germination, growth and farm work.

Rainfall, somewhat below the average, was favorably distributed over the State and throughout the month. The rainy periods were the first decade, and the 18th-22d, with the heaviest rainfall generally on the 8th-10th. This heavy rain caused a sharp rise in the Ohio river and tributaries, but no flood resulted. Snowfall was half the normal. High winds and heavy hail, accompanying scattered thunderstorms, did much damage in the southern part of the State on late afternoon of the 18th. Considerable loss to young plants, fruit trees, roofs and houses resulted. The number of clear days and the percentage of sunshine were well above the normal.

There was some injury to fruit from frost and freezing temperature in north-central counties, apples being reported seriously damaged. Light to heavy hail fell in Mingo County on the 18th, causing an estimated damage of $1,000 to $1,500 in the vicinity of Chataroy and Williamson.—*H. C. D.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 56 stations, was 54.8°, or 3.0° above the normal. The mean for the northeastern panhandle division was 52.6°; for the northern division, 54.6°; and for the southern division 55.8°. The highest monthly mean was 59.6° at Charleston and Huntington and the lowest, 45.4° at Bayard. The highest temperature was 92° at McNeill on the 27th and at Martinsburg on the 28th and the lowest, 18° at Pickens on the 10th and Bayard on the 11th. The greatest daily range was 57° at Bayard on the 27th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 103 stations, was 3.06 inches, which is 0.45 inch below the normal. In the northeastern panhandle division the average was 1.72 inches; in the northern division, 3.27 inches; and in the southern division 3.14 inches. The greatest monthly precipitation was 4.90 inches at Charleston and the least, 1.08 inches at Wardensville. The greatest amount in any 24 consecutive hours was 2.01 inches at Point Pleasant on the 9th. The average monthly snowfall was 0.9 inch, or 0.9 inch below normal. The greatest monthly snowfall was 6.5 inches at Camden-on-Gauley. The average number of days with .01 inch or more of precipitation was 10.

ERRATA

March 1938: Average precipitation for the State should read 4.02 inches. Brandywine: Precipitation on 3d, 0.10 inch; total for the montn, 2.20 inches. Madison: Mean temperature, 49.1°.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. † Also on other dates.

Daily Precipitation for April 1938

VOL. XLVI PARKERSBURG, W. VA., MAY 1938 No. 5

GENERAL SUMMARY

May was slightly below normal in temperature and exceptionally wet, being the sixth wettest of May State record. Rainfall was above the normal in all parts of the State during the month. Amounts in excess of seven inches were received at sixteen stations, and more than ten inches fell at two stations. The heavy rains caused a near flood in the Little Kanawha river on the 20th-21st, and moderately high stage in the Ohio river.

Heavy to killing frosts and below freezing temperature occurred generally in the northern Ohio Valley and in the north central partof the State on the 12-13th. The lowest temperature of the month occurred at all stations at that time. At Parkersburg, a temperature of 31 degrees occurred which was the lowest of record for May. The temperature fell to 32 degrees or lower at about half of the reporting stations.

Gusts attending thunderstorms on the 14th over the southern section of the State, caused local damage in Kanawha and Raleigh counties. At Beckley, a circus tent collapsed, and an airplane hangar roof was moved and damaged several airplanes. At Dunbar a school house was unroofed. Damage estimated at between $4,000 and $5,000. Light hail fell generally on the 14th and at scattered localities on the 4th, 5th, 19th-21st, 23d, and 28-29th. No damage was reported.

Owing to frequent rains and low temperature until the last week, the month was unfavorable for farm work.—*H.C.D.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 58 stations, was 61.1°, or 0.6° below the normal. The mean for the northeastern panhandle division was 60.3°; for the northern division, 60.7°; and for the southern division 61.9°. The highest monthly mean was 65.6° at Huntington and the lowest, 53.5° at Bayard. The highest temperature was 94° at Glenville on the 5th and the lowest, 20° at Bayard on the 13th. The greatest daily range was 60° at McNeill on the 4th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 5.97 inches, which is 2.01 inches above the normal. In the northeastern panhandle division the average was 5.26 inches; in the northern division, 6.25 inches; and in the southern division 5.78 inches. The greatest monthly precipitation was 10.51 inches at Glenville and the least, 3.62 inches at Inwood. The greatest amount in any 24 consecutive hours was 2.80 inches at Harpers Ferry on the 24th. The average monthly snowfall was Trace, or normal. The greatest monthly snowfall was 0.8 inch at Spruce Knob. The average number of days with .01 inch or more of precipitation was 16.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days, etc. † Also on other dates.

Daily Precipitation for May 1938

VOL. XLVI   PARKERSBURG, W. VA., JUNE 1938   No. 6

GENERAL SUMMARY

June was a rainy month with fairly uniform frequency of occurrence over the State. Notably heavy falls were recorded on the 10-12th and from the 16th to the 27th. Amounts in excess of three inches in 24 consecutive hours occurred at New Cumberland, Saint Marys, Dam 19 O. R., and Weston. As a whole the month was one of the rainiest of record, only two years, 1907 and 1928 being greater. The rainfall was in excess of the normal at all stations. Torrential rain, attending an electrical storm, fell over Ritchie county on the 24th, causing inestimable damage to homes, barns, automobiles, garages, bridges, highways, railroads and crops, along Goose Creek and near Petroleum. Two women were killed by lightning near Glenville.

The monthly temperature averages were below normal at all stations, except a few in the northeastern panhandle section, where the averages were slightly above normal.

Heavy hail on the 16th in the eastern part of Logan county, caused considerable damage to crops and roofs.

Owing to wet soil, planting and cultivation were much delayed. At the close of the month corn was about two weeks late, while pastures and meadows were making good growth. —*H. C. D.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 58 stations, was 67.8°, or 1.8° below the normal. The mean for the northeastern panhandle division was 67.8°; for the northern division, 67.3°; and for the southern division 68.3°. The highest monthly mean was 73.0° at Bancroft and the lowest, 60.0° at Bayard. The highest temperature was 97° at Inwood and Martinsburg, on the 11th and 24th, respectively, and the lowest, 28° at Bayard on the 1st. This was within a degree of the record low temperature for June. The greatest daily range was 48° at McNeill on the 6th and 7th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 5.69 inches, which is 1.48 inches above the normal. In the northeastern panhandle division the average was 3.71 inches; in the northern division, 6.31 inches; and in the southern division 5.39 inches. The greatest monthly precipitation was 9.65 inches at Brownsville and the least, 2.15 inches at Wardensville. The greatest amount in any 24 consecutive hours was at New Cumberland on the 11th, when 3.69 inches fell in one hour and fifty minutes. Precipitation amounting to 0.01 inch or more fell on an average of 14 days.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days, etc. † Also on other dates.

Daily Precipitation for June 1938

VOL. XLVI PARKERSBURG, W. VA., JULY 1938 No. 7

GENERAL SUMMARY

Rainfall was considerably deficient in the northern Ohio Valley Counties and somewhat deficient thence southeastward into Pocahontas County, while the remainder of the State was unusually wet, with a marked excess in Tucker and Preston Counties and the basins of the Kanawha and its tributaries. Heavy local showers were frequent, particularly during the second half of the month, causing considerable flooding of lowlands along creeks and of city streets. Noteworthy instances were: 9th, Parkersburg, many streets inundated, with much minor damage, mainly from mud and debris, to streets and cellars. 19th, Stonecoal Creek, Raleigh County, overflowed, inundating East Gulf, Killarney and Mead, and suspended operations temporarily at two coal mines. 20th, Henry's Fork, Roane County, went out of its banks and caused a two-story building to collapse, and swept away several small buildings at Tariff and Linden; three sections of B&O track between Buckhannon and Weston were washed out. 21st, Bluefield's streets ran curbfull, damaging thorofares that were being paved. 22d, Charleston's streets were flooded, damaging several business houses and homes; many small spans on secondary roads were washed out in Roane and Cabell Counties. 23d, Stonecoal Creek again overflowed and about 1,000 persons were driven from their homes in small communities along this creek as well as Besoco and Tommy Creeks, with the entire town of Rhodell flooded to a depth of three feet; two highway bridges were damaged and a number of small foot bridges were washed out; landslides blocked the Virginian Railway between East Gulf and Besoco and U. S. Route 19 near Ireland, Lewis County: three bridges over State Route 36 were weakened.

Temperature was above normal except in central and southern sections where it was slightly below normal. The wet weather retarded farm work, except in the dry areas and damaged grain and forage crops at harvest time. Corn made good progress, but was badly in need of cultivation. Potatoes showed blight and ground rot in the wet districts.

TEMPERATURE

The average monthly temperature for the State, based on the records of 58 stations, was 73.6°, or 0.4° above the normal. The mean for the northeastern panhandle division was 73.8°; for the northern division, 73.5°; and for the southern division, 73.5°. The highest monthly mean was 78.0° at Martinsburg and the lowest, 66.4° at Bayard. The highest temperature was 103° at Inwood on the 11th and the lowest, 37° at Bayard on the 5th. The greatest daily range was 45° at Bayard on the 8th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 5.58 inches, or 0.99 inch above normal. In the northeastern panhandle division the average was 5.09 inches; in the northern division, 5.00 inches; and in the southern division 6.65 inches. The greatest monthly precipitation was 11.50 inches at Rowlesburg and the least, 1.16 inches at Dam 13, O. R. (McMechen). The greatest amount in any 24 consecutive hours was 3.31 inches at Rowlesburg on the 22-23d. The average number of days with .01 inch or more of precipitation was 14.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days, etc. † Also on other dates.

Daily Precipitation for July 1938

VOL. XLVI PARKERSBURG, W. VA., AUGUST 1938 No. 8

GENERAL SUMMARY

Temperature during August averaged about two degrees above the normal for the State, as a whole. The month has been warmer only six times in the last 48 years, in which period the highest average temperature for the State was 76.0° in 1900 and 1918. The first two decades were nearly continuously warm. Droughty conditions prevailed in nearly all sections, particularly in the northern half of the State, during the last half of the month. At the close of the month small streams and springs were becoming dry, and some farmers were hauling water for domestic use and stock. Crops were seriously damaged, fields, meadows and pastures were turning brown. While the average precipitation for the State as a whole was the lightest of record since 1930, yet in the counties of Logan, Mingo, McDowell, Wayne and the southern portion of Greenbrier, the rainfall continued well in excess of the normal. Showers occurred frequently during the first half of the month. Heavy to excessive local rains occurred on the 4th, 8th and 12th in Wayne, Mingo and Logan Counties respectively, where considerable destruction was done by flooding, slides along highways and washing away of crops. A local thundersquall, on the 17th, did some damage at Parkersburg, when a house was unroofed and chimneys blown down. No damaging hailstorms occurred. The average number of clear days was the second highest of record.—*H. C. D.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 73.7°, or 1.9° above the normal. The mean for the northeastern panhandle division was 73.3°; for the northern division, 73.5°; and for the southern division, 74.0°. The highest monthly mean was 78.4° at Bancroft and the lowest, 65.9° at Bayard. The highest temperature was 100° at Martinsburg on the 14th and 16th and the lowest, 35° at Bayard on the 30th. The greatest daily range was 48° at Bayard on the 30th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 2.58 inches, or 1.52 inches below normal. In the northeastern panhandle division the average was 2.54 inches; in the northern division, 2.19 inches; and in the southern division 3.19 inches. The greatest monthly precipitation was 7.03 inches at Wayne and the least, 0.78 inch at Elk (Harrison County). The greatest amount in any 24 consecutive hours was 3.70 inches at Wayne on the 12th. The average number of days with .01 inch or more of precipitation was 8.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days, etc. † Also on other dates.

Daily Precipitation for August 1938

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. XLVI PARKERSBURG, W. VA., SEPTEMBER 1938 No. 9

GENERAL SUMMARY

The month averaged somewhat below normal in temperature. About one-third of the reporting stations, principally in the Tygart Valley and the southern division, reported temperature in excess of normal. The cool periods were the 2-3d and 19th-22d, but no frost was reported.

Precipitation averaged slightly above normal for the State, the only deficiencies occurring in the Tug Fork, Guyandot, West Fork and Monongahelia Valleys and a few scattered localities elsewhere, mainly near the central Virginia border line. The drought that started about the middle of August was broken in the eastern border Counties on the 1st and generally throughout the State during the middle decade of September, when most of the rainfall of the month occurred, with fourteen stations reporting 24-hour amounts of two inches or more. However, a return to droughty conditions was in evidence at the close of the month.

High winds, attending a severe thunderstorm, caused much damage at Moundsville on the 7th. Trees and power line poles were toppled; many tents at the county fair collapsed and rain ruined the contents; one building almost demolished by falling tree.

Weather conditions were generally favorable for crop growth and harvesting. Fall plowing proceeded and some cover crops were sown.

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 65.8°, or 0.6° below the normal. The mean for the northeastern panhandle division was 63.6°; for the northern division, 65.2°; and for the southern division, 67.3°. The highest monthly mean was 71.8° at Bancroft and the lowest, 57.5° at Bayard. The highest temperature was 95° at Bens Run on the 4th, Martinsburg on the 5th and Point Pleasant on the 6th and the lowest, 28° at Bayard on the 26th. The greatest daily range was 50° at Bayard on the 26th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 3.59 inches, or 0.67 inch above the normal. In the northeastern panhandle division the average was 3.45 inches; in the northern division, 3.57 inches; and in the southern division, 3.97 inches. The greatest monthly precipitation was 7.30 inches at Spruce Knob and the least, 1.63 inches at New Martinsville. The greatest amount in any 24 consecutive hours was 3.52 inches at Huntington on the 13th. The average number of days with .01 inch or more of precipitation was 10.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days, etc. † Also on other dates.

Daily Precipitation for September 1938

VOL. XLVI PARKERSBURG, W. VA., OCTOBER 1938 No. 10

GENERAL SUMMARY

The month was the driest October since 1924. Only four Octobers had less precipitation. Monthly totals in excess of one inch were confined practically to the northern and the northeastern panhandles and the north-central Counties. Droughty conditions that began in September continued unabated throughtout October and created a fire hazard of marked proportions. During the second half of the month forest fires were frequent, especially in the southern half of the State where the damage was extended rather than local. This situation continued at the close of the month.

Temperature was only slightly above normal. The middle decade was unseasonably warm, with several stations reporting readings of 90° or slightly higher. The first killing frost of Autumn occurred at a few northern stations on the 3d, more generally on the 8th and scatteringly in the central Counties on the 25th and 31st.

Clear skies predominated, although there was a considerable amount of fog, haze and smoke to lower visibility.

The weather was favorable for farm work and much of the corn crop was housed. Cover crops, however, were in need of rain. Streams were low. Water was being hauled for stock in some sections.

TEMPERATURE

The average monthly temperature for the State, based on the records of 58 stations, was 55.0°, or 0.4° above the normal. The mean for the northeastern panhandle division was 53.7°; for the northern division, 54.4°; and for the southern division, 56.1°. The highest monthly mean was 60.8° at Bancroft and the lowest, 46.4° at Bayard. The highest temperature was 92° at Grafton on the 18th and the lowest, 15° at Bayard on the 8th and 9th. The greatest daily range was 57° at McNeill on the 18th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 107 stations, was 0.89 inch, or 1.96 inches below the normal. In the northeastern panhandle division the average was 1.34 inches; in the northern division, 0.94 inch; and in the southern division, 0.66 inch. The greatest monthly precipitation was 1.92 inches at McNeill and the least, 0.12 inch at Lewisburg. The greatest amount in any 24 consecutive hours was 1.20 inches at McNeill on the 20th. Spits of snow were observed at Martinsburg on the 7th and at Spruce Knob on the 27th. The average number of days with .01 inch or more of precipitation was 4.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. † Also on other dates.

Daily Precipitation for October 1938

VOL. XLVI PARKERSBURG, W. VA., NOVEMBER 1938 No. 11

GENERAL SUMMARY

Temperatures averaged well above normal, with only a few scattered stations reporting minus departures. The warm periods were: 2d-7th, 11-13th, 17-19th, and 21st-22d, when the average daily excess was 12°. The cold period was from the 23d to 29th, when temperatures averaged 12° below normal and minima of zero or below were recorded at twelve stations. The reading of −10° at Bayard on the 26th was the second lowest November temperature of record. The first killing frost of Autumn occurred generally in the southern Counties on the 9th.

The month was unusually wet for November, with the average precipitation the greatest since 1929 and the average snowfall the second greatest of record. Only one November (1913) had more snow. The snow fell during the cold spell and blanketed the entire State with amounts ranging from 2 to 20 inches. At the close of the month the snow cover remained over much of the northern half of the State and at a few high-level stations in the southern half, with the depths ranging from 2 inches at Flat Top to 8 inches at Rowlesburg.

Forest fires continued generally until the 5th when they were put out by widespread drenching rains. Frequent rains replenished streams and helped vegetation, while the snow cover protected vegetation during the cold weather.

TEMPERATURE

The average monthly temperature for the State, based on the records of 60 stations, was 44.7°, or 1.5° above the normal. The mean for the northeastern panhandle division was 43.3°; for the northern division, 43.9°; and for the southern division, 46.0°. The highest monthly mean was 50.4° at Bancroft and the lowest, 37.9° at Bayard. The highest temperature was 86° at Bens Run and Huntington on the 7th and the lowest, −10° at Bayard on the 26th. The greatest daily range was 66° at Bayard on the 10th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 109 stations was 3.96 inches, or 1.20 inches above the normal. In the northeastern panhandle division the average was 2.68 inches; in the northern division, 4.22 inches; and in the southern division, 4.05 inches. The greatest monthly precipitation was 5.87 inches at Philippi, and the least, 1.89 inches at Knobly Mountain. The greatest amount in any 24 consecutive hours was 2.00 inches at Grafton on the 24th. The average monthly snowfall was 11.0 inches, or 8.6 inches above normal. The greatest monthly snowfall was 20.0 inches at Buckhannon. The average number of days with .01 inch or more of precipitation was 9.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. † Also on other dates.

Daily Precipitation for November 1938

VOL. XLVI PARKERSBURG, W. VA., DECEMBER 1938 No. 12

GENERAL SUMMARY

The month was practically normal in temperature. There were brief cold spells centering on the 15-16th and 28-29th; otherwise the temperature was normal or above, with the warm period from the 2d to 12th. Only three stations reported readings of zero or lower, while the State minimum of −5° was the highest State minimum for December since 1933. On the other hand, no station reported a reading of 70°, as is usual for the month.

It was the driest December since 1925 and the fourth driest December of record. Only the northeastern Panhandle reported normal amounts, while the marked deficiencies occurred in the northern division. The snowfall was the lightest December amount since 1931. The bulk of the snow fell at high-level stations, with little or none in the great valleys. Some sleet fell at scattered points during the last decade. Snows on the 21st made highway traveling hazardous in Tucker and surrounding Counties.

High winds were rather general from the 26th to the 28th, and on the 26th caused much minor damage, principally to wires and poles, in the north-central Counties.

Winter crops made fair progress, although lacking a protective snow cover. Some plowing was done during the first half of the month.

UNIVERSITY OF ILLINOIS

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 34.7°, or 0.1° above the normal. The mean for the northeastern panhandle division was 34.5°; for the northern division, 32.9°; and for the southern division, 35.6°. The highest monthly mean was 39.2° at Bancroft and the lowest, 27.0° at Bayard. The highest temperature was 69° at Hinton on the 4th and the lowest, −5° at Bayard on the 29th. The greatest daily range was 44° at Bayard on the 17th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 108 stations was 1.81 inches, or 1.50 inches below the normal. In the northeastern panhandle division the average was 2.60 inches; in the northern division, 1.58 inches; and in the southern division, 1.87 inches. The greatest monthly precipitation was 4.58 inches at Martinsburg and the least, 0.60 inch at Shinnston. The greatest amount in any 24 consecutive hours was 2.28 inches at Wardensville on the 10th. The average monthy snowfall was 2.1 inches, or 4.2 inches below the normal. The greatest monthly snowfall was 16.5 inches at Stony River Dam. The average number of days with .01 inch or more of precipitation was 9.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. † Also on other dates.

Daily Precipitation for December 1938

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

Vol. XLVI PARKERSBURG, W. VA., YEAR 1938 No. 13

GENERAL SUMMARY

The year averaged 1.5° above normal in temperature, with the Winter months well above normal. Only May, June and September were below normal and then only slightly so. The severest cold period occurred during the last decade of November, when minima of zero or lower were recorded at twelve stations. The highest annual mean temperature was 59.1° at Bancroft and the lowest, 46.9° at Bayard. The highest temperature was 103° at Inwood on July 11th and the lowest, -10° at Bayard on November 26th.

Precipitation was slightly below normal. May, June and July were unusually wet while September and November averaged above normal. Marked deficiencies occurred In January, August and October. Snowfall was light, except in November which was the second snowiest November of record. The greatest annual precipitation was 62.13 inches at Pickens and the least, 26.26 inches at Wardensville. The greatest annual snowfall was 69.0 inches at Pickens.

The growing season in the northern and northeastern panhandle divisions was from May 12th to October 9th and in the southern division from April 11th to November 9th.

The Ohio river did not reach flood stage.

THE WEATHER BY MONTHS

JANUARY.—Temperature above normal; only two stations reported readings of zero or lower. Precipitation averaged 1.50 inches below normal. Snowfall was less than one-half the normal. Favorable weather permitted outdoor activities during greater part of month. Winter grains made good growth and there was considerable winter plowing.

FEBRUARY.—Second warmest February of record. No zero temperature was recorded. Precipitation was practically normal, but snowfall was about one-third of the normal. The Ohio River was at moderately high stage during the middle of the month.

MARCH.—Very warm, averaging 5.8 degrees above normal. Precipitation was slightly above normal, while snowfall was very light. Rivers were at moderate stage throughout the month. Fruit was coming into bloom, but farm work was much retarded by frequent rains. Winter grains and pastures made good growth.

APRIL.—Much warmer and slightly drier than usual. Rainfall was favorably distributed and was heavy generally on the 8-10th, causing a sharp rise in the Ohio River and tributaries, but no flood resulted. Germination advanced rapidly. Frost on the 11th and 23d caused some injury to fruit in north-central counties.

MAY.—Sixth wettest May of record. Heavy rains caused a near flood in the Little Kanawha River on the 20th-21st and moderately high stage in the Ohio River. Temperature was slightly below normal. Heavy to killing frosts occurred generally in the northern Ohio Valley and the north-central Counties on the 12-13th, causing considerable damage to vegetation.

JUNE.—Third wettest June of record. Four stations reported three inches or more in 24 consecutive hours. Much damage in Ritchie County on the 24th from heavy rains and local flooding. Temperature was below normal. Planting and cultivating much delayed by wet soil.

JULY.—Temperature slightly above normal. Rainfall was deficient in the northern Panhandle and some east-central localities, but unusually wet weather prevailed elsewhere. Heavy local showers were frequent, causing considerable flooding of lowlands along creeks and of city streets. Wet weather retarded farm work and damaged grain and forage crops at harvest time, while corn was badly in need of cultivation and potatoes showed blight and ground rot in the wet districts.

AUGUST.—Temperature continued above normal. Rainfall averaged well below normal, except in some southern sections where it was much in excess of the normal. Heavy to excessive local rains occurred in southern sections during the first half of the month, causing considerable destruction by flooding, slides along highways and washing away of crops.

SEPTEMBER.—Temperature was slightly below normal. Rainfall was slightly above normal, although droughty conditions were in evidence at the close of the month. Conditions were generally favorable for crop growth and harvesting.

OCTOBER.—Temperature only slightly above normal. Driest October since 1924. Only four Octobers had less precipitation. Droughty conditions that began in September continued unabated throughout the month and created a fire hazard of marked proportions. During the second half of the month forest fires were frequent, especially in the southern half of the State where the damage was extended rather than local. This situation continued at the close of the month. Streams were low. Weather was favorable for farm work and much of the corn crop was housed.

NOVEMBER.—Temperature averaged well above normal. The month was unusually wet. The snowfall was the second greatest of November record. The snow fell during a cold spell and blanketed the State with amounts ranging from 2 to 20 inches. Forest fires continued generally until the 5th when they were put out by widespread drenching rains. Frequent rains replenished streams and helped vegetation, while the snow cover protected vegetation during the only cold period of the month.

DECEMBER.—Temperature was practically normal. It was the driest December since 1925 and the fourth driest December of record. The snowfall was the lightest December amount since 1931. Winter crops made fair progress although lacking a protective snow cover. Some plowing done during second half of the month.

VOL. XLVII PARKERSBURG, W. VA., JANUARY 1939 No. 1

GENERAL SUMMARY

Temperature was well above the normal. Only one station reported a deficiency and that was very slight. The marked excess occurred during the first half of the month. Cold spells were brief as a rule, with the major one prevailing from the 23d to the 28th. Precipitation was slightly below normal. Days with precipitation were rather evenly distributed, but the greater amounts fell during the second half of the month. Snowfall averaged above normal, with monthly totals in excess of 20 inches generally reported from the Maryland Line southwestward into Greenbriar and Nicholas Counties. Snow-lying days ranged from one in the southwestern Counties to 22 at Spruce Knob. At the close of the month snow covers were confined to the northern half of the State and a few high-level stations in the Southeast. The depths were mostly small, but as much as 16 inches was reported from Spruce Knob. Thunderstorms occurred at many stations on the 30th, with one building near Ireland being damaged by lightning. High winds prevailed on the 22d and 25th, causing some minor damage in Hardy County on the 22d. Heavy rains at close of month had started rivers and streams to rise.

Very little farm work was accomplished, but cover crops continued to make fair progress.

TEMPERATURE

The average monthly temperature for the State, based on the records of 57 stations, was 36.4°, or 3.6° above the normal. The mean for the northeastern panhandle division was 33.8°; for the northern division, 36.2°; and for the southern division, 37.6°. The highest monthly mean was 41.4° at Bancroft and the lowest, 28.6° at Bayard. The highest temperature was 80° at Spencer on the 4th and the lowest, −7° at Rainelle on the 28th. The greatest daily range was 52° at Gary on the 29th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 3.59 inches, or 0.11 inch below the normal. In the northeastern panhandle division the average was 3.22 inches; in the northern division, 3.66 inches; and in the southern division, 3.65 inches. The greatest monthly precipitation was 11.36 inches at Pickens and the least, 1.68 inches at Romney. The greatest amount in any 24 consecutive hours was 2.76 inches at Pickens on the 30th. The average monthly snowfall was 11.0 inches, or 3.1 inches above the normal. The greatest monthly snowfall was 50.0 inches at Alpena. The average number of days with .01 inch or more of precipitation was 14.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for January 1939

VOL. XLVII PARKERSBURG, W. VA., FEBRUARY 1939 No. 2

GENERAL SUMMARY

The month was well above normal in both temperature and precipitation. Only six Februarys were warmer, five of these occurring within the last fifteen years. Zero weather was confined practically to one day and to the north-central counties, with ten stations reporting readings of zero or slightly lower. The only extensive cold period was from the 22d to 25th, while warm spells occurred at frequent intervals. It was the third wettest February on record and the wettest since 1903. The heaviest amounts occurred in the central and southwestern Counties, while in the northeastern panhandle division the totals were from one inch to one and one-half inches less than in the other divisions. Heavy to excessive rains fell on the 2-3d, with the average for the State, 2.20 inches; for the Little Kanawha Valley, 2.62 inches; for the southern division, 2.55 inches; and for the immediate Great Kanawha Valley (Charleston to Point Pleasant), 3.28 inches. These rains caused rapid rises in the rivers. Flood stages were reached or exceeded in the Cheat, West Fork, Tygart (above Tygart Dam), Little Kanawha and Elk Rivers and Twelvepole Creek, while the Ohio River was in flood at and below Pomeroy, Ohio. Damage to roads, bridges, homes and stores was considerable.

The weather was generally favorable for winter crops and during the second half of the month for farm work.

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 39.0°, or 5.6° above the normal. The mean for the northeastern panhandle division was 37.5°; for the northern division, 38.0°; and for the southern division, 40.5°. The highest monthly mean was 44.7° at Bancroft, and the lowest, 30.5° at Bayard. The highest temperature was 80° at Hinton on the 19th, and the lowest −2° at Bayard on the 23d and 24th and at Creston on the 23d. The greatest daily range was 52° at McNeill on the 19th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 105 stations, was 5.72 inches, or 2.56 inches above the normal. In the northeastern panhandle division the average was 3.80 inches; in the northern division, 5.93 inches; and in the southern division, 6.21 inches. The greatest monthly precipitation was 8.26 inches at Pickens, and the least 2.40 inches at McNeill. The greatest amount in any 24 consecutive hours was 2.67 inches at Wayne on the 2-3d. The average monthly snowfall was 3.9 inches, or 4.4 inches below normal. The greatest monthly snowfall was 13.0 inches at Wheeling. The average number of days with .01 inch or more of precipitation was 13.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for February 1939

VOL. XLVII   PARKERSBURG, W. VA., MARCH 1939   NO. 3

GENERAL SUMMARY

The month was above normal in temperature. There was one brief cold period–16th to 19th–but no zero temperatures were reported. The markedly warm periods were, 4-6th, 9th, and 23d-27th.

Precipitation was slightly above normal, except in the northeastern panhandle where it averaged well below normal. The greatest amounts fell in the southwestern Counties. The periods of precipitation were short, as a rule, with steady falls on the 5-6th, 11-13th, 27-28th and 29-30th. Snowfall was very light, with measureable amounts confined generally to the high-level stations. Scattered occurrences of hail and sleet of no consequence were noted.

Numerous small forest fires occurred in the southern Counties during the last decade of the month, principally in Raleigh, McDowell and Logan Counties. They were extinguished by the rains of the 27-28th.

The month was generally favorable for crop growth; pastures and grains made good progress. Ground preparation proceeded at a good pace. At the close of the month fruit trees were budding.

THE LIBRARY OF THE
MAY 5 1939
UNIVERSITY OF ILLINOIS

TEMPERATURE

The average monthly temperature for the State, based on the records of 58 stations, was 44.9°, or 2.4° above the normal. The mean for the northeastern panhandle division was 43.5°; for the northern division, 44.0°; and for the southern division, 46.2°. The highest monthly mean was 51.0° at Bancroft and the lowest, 36.0° at Bayard. The highest temperature was 87° at London Locks on the 25th and the lowest, 3° at Alpena on the 19th. The greatest daily range was 53° at Benson and Greenbottom on the 19th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 108 stations, was 4.21 inches, or 0.27 inch above the normal. In the northeastern panhandle division the average was 2.29 inches; in the northern division, 4.93 inches; and in the southern division, 4.64 inches. The greatest monthly precipitation was 7.81 inches at Greenbottom and the least, 1.48 inches at Petersburg. The greatest amount in any 24 consecutive hours was 2.80 inches at Greenbottom on the 5th. The average monthly snowfall was 0.5 inch, or 5.3 inches below the normal. The greatest monthly snowfall was 4.0 inches at Alpena, Pickens, and Spruce Knob. The average number of days with .01 inch or more of precipitation was 10.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for March 1939

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. XLVII PARKERSBURG, W. VA., APRIL 1939 No. 4

GENERAL SUMMARY

The month was cold and wet. The first half was consistently cold, with frequent frosts, except for a brief warm spell on the 10-11th, while there were also two cold periods, with frost, during the second half. The warm spells were infrequent and of short duration. It was the third wettest April of record and the wettest since 1927. The only sections reporting deficiencies in precipitation were Hancock County and the southern Counties from Mingo and McDowell eastward into Greenbrier. Measureable snow was confined to the high-level stations and was somewhat below normal. Heavy to excessive rains fell during the period 14-17th and scatteringly on the 18th, causing rapid rises in the rivers in the western half of the State, with flood stages occurring in the Elk and Little Kanawha basins, the Tygart basin below the Dam and the Ohio basin at and below Point Pleasant. The Little Kanawha at Creston was the highest of record, cresting at 33.2 feet, or 1.2 feet above the previous record.

The weather was generally unfavorable for germination and farm work, except in the eastern border Counties. Small fruits were damaged considerably and apples and peaches were damaged less seriously by the frosts. Progress of grains and grasses were hindered.

THE LIBRARY OF THE
MAY 31 1939
UNIVERSITY OF ILLINOIS

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 49.9°, or 1.8° below the normal. The mean for the northeastern panhandle division was 48.7°; for the northern division, 48.9°; and for the southern division, 51.3°. The highest monthly mean was 55.2° at Williamson and the lowest, 39.9° at Bayard. The highest temperature was 92° at Hinton on the 24th and the lowest, 12° at Bayard on the 8th. The greatest daily range was 60° at Beckley on the 5th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 5.36 inches, or 1.81 inches above the normal. In the northeastern panhandle division the average was 3.91 inches; in the northern division, 6.03 inches; and in the southern division, 4.85 inches. The greatest monthly precipitation was 8.81 inches at Greenbottom and the least, 1.59 inches at Union. The greatest amount in any 24 consecutive hours was 4.30 inches at Greenbottom on the 16th. The average snowfall was 0.8 inch, or 1.0 inch below normal. The greatest monthly snowfall was 6.7 inches at Pickens. The average number of days with .01 or more of precipitation was 15.

ERRATA

March 1939, Page 9: Average precipitation for the State should read 4.20 inches; for the northern division 4.43 inches.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for April 1939

VOL. XLVII PARKERSBURG, W. VA., MAY 1939 No. 5

GENERAL SUMMARY

The month was the driest May of record, with twenty-two long established stations reporting the least May amounts and twelve stations reporting the second driest May of record. All stations reported deficiencies, but the most pronounced lack of rain occurred in the Ohio Valley Counties and portions of the north-central, Grant and Hardy Counties. Monthly totals of less than one-half inch occurred in Brooke, Monongalia, Marion, Harrison, Wood and Mason Counties. Monthly totals in excess of two inches occurred generally over a rather narrow belt extending from McDowell northeastward into Pendleton and Tucker Counties.

Temperature was well above the normal; only two stations reporting means below normal. Unusually cool weather, with frosts, prevailed from the 1st to 5th and from the 11th to 16th, with the low reading of 19° at Seneca State Forest on the 4th equalling the lowest of State record for May. The temperature was consistently above normal during the remainder of the month.

The weather was unfavorable for vegetation, except grains locally in the northeastern panhandle and corn generally throughout the State. Pastures and forage crops suffered particularly from the drought.

Three persons in Logan and Raleigh Counties were struck by lightning and severely burned, on the 25th.

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 63.5°, or 1.8° above the normal. The mean for the northeastern panhandle division was 62.7°; for the northern division, 63.4°; and for the southern division, 64.0°. The highest monthly mean was 68.4° at Williamson and the lowest, 53.8° at Bayard. The highest temperature was 100° at Martinsburg on the 31st and the lowest, 19° at Seneca State Forest on the 4th. The greatest daily range was was 53° at Inwood and Seneca State Forest on the 6th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 1.38 inches, or 2.57 inches below the normal. In the northeastern panhandle division the average was 1.67 inches; in the northern division, 1.22 inches; and in the southern division, 1.50 inches. The greatest monthly precipitation was 3.78 inches at Dailey and the least, 0.36 inch at Dam No. 15 (Monongahela River) and Wellsburg. The greatest amount in any 24 consecutive hours was 1.87 inches at Wardensville on the 21st-22d. The average monthly snowfall was trace, or normal. The greatest monthly snowfall was 1.0 inch at Stony River Dam. The average number of days with .01 inch or more of precipitation was 7.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for May 1939

VOL. XLVII PARKERSBURG, W. VA., JUNE 1939 NO. 6

GENERAL SUMMARY

The month was the second wettest June of record. However, the distribution was rather uneven, with the heaviest amounts occurring in the north-central districts, where totals were from two to three times the June normal. Amounts were below normal in the Elk and lower Kanawha Valleys, Wayne, Boone, McDowell, Monroe, and Greenbrier Counties, and two stations in the northeastern panhandle division.

Temperatures were well above normal, the month being the fourth warmest June of record, with all stations reporting an excess in temperature. There were only two brief spells of cool weather: 12th-14th and 23d-24th.

A severe electrical storm occurred at Morgantown on the 2d, igniting three oil storage tanks and damaging slightly a schoolhouse roof. On the 22d in Calhoun County one young man was killed and another seriously injured when struck by lightning.

The weather was generally favorable for vegetation. Corn continued to make excellent progress, while potatoes, forage crops, and pastures recovered from the May drought. Fruit is about average except apples which crop is short.

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 72.7°, or 3.0° above the normal. The mean for the northeastern panhandle division was 71.2°; for the northern division, 72.2°; and for the southern division, 73.8°. The highest monthly mean was 78.4° at Williamson and the lowest, 63.7° at Bayard. The highest temperature was 101° at Hinton on the 16th and the lowest, 33° at Bayard on the 5th. The greatest daily range was 52° at Seneca State Forest on the 7th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 105 stations, was 6.23 inches, or 1.82 inches above the normal. In the northeastern panhandle division the average was 5.91 inches; in the northern division, 7.32 inches; and in the southern division, 4.50 inches. The greatest monthly precipitation was 13.36 inches at Morgantown and the least, 2.24 inches, at Wayne. The greatest amount in any 24 consecutive hours was 2.50 inches at Creston on the 22d. The average number of days with .01 inch or more of precipitation was 14.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for June 1939

VOL. XLVII PARKERSBURG, W. VA., JULY 1939 No. 7

GENERAL SUMMARY

This was the coolest July since 1924. Mean temperatures were generally below normal, except for a few counties in the extreme northern and southern parts of the state. Generally, the highest temperatures were in the 90's and occurred on the 8th. The 13th and the 26th to the 28th were also dates when the near 90's or over occurred. These temperatures were offset by cool nights and cool periods during the first and middle of the month. Light frost occurred at Terra Alta on the 16th.

Rainfall was considerably above normal over the entire state, except for Hancock, Brooke, Ohio, Preston, Gilmer, Wayne, and Fayette Counties and portions of Harrison, Lewis, and Roane Counties, where slight deficiencies were reported. On July 9th a heavy rain at the head of the small tributaries of Burning Springs Run caused a destructive flood at the village of Burning Springs. Farm crops were completely overflowed, oil tanks and equipment were washed away, and several houses were flooded and occupants were forced to flee. Beckley suffered damage in a thunderstorm on the 19th. Heavy precipitation of the 19th to the 21st, inclusive, caused the Tygart River to reach a crest of 9.60 feet at Dailey on the 21st, which was 0.6 foot above flood stage. A heavy local storm on the 29th brought Stillwell Creek over its banks, causing some damage to the road and two bridges on U. S. Highway 50 near Dallison, Wood County. The creek in flood washed out crops and corn fields and caused some loss by drowning to farm stock.

Storm damage was reported in Braxton and Marion Counties and at Waverly Station. Also considerable damage was done to areas around Rosedale, Fairview, Farmington, Fairmont, and Mannington by excessive rains that fell on the 29th. On the same date Berkeley Springs had a very heavy rain with no damage; and Huntington reported a rainfall of 2.94 in two hours with very little damage.—C. L. W.

TEMPERATURE

The average monthly temperature for the State, based on the records of 58 stations, was 72.1°, or 1.1° below the normal. The mean for the northeastern panhandle division was 71.2°; for the northern division, 71.5°; and for the southern division, 73.3°. The highest monthly mean was 78.4° at Williamson and the lowest, 63.3° at Bayard. The highest temperature was 99° at Hinton on the 13th and the lowest, 33° at Bayard on the 16th. The greatest daily range was 47° at McNeill and Seneca State Forest on the 16th.

PRECIPITATION

The average monthly precipitation for the State. based on the records of 105 stations, was 5.81 inches, or 1.20 inches above the normal. In the northeastern panhandle division the average was 5.54 inches; in the northern division, 5.56 inches; and in the southern division, 6.37 inches. The greatest monthly precipitation was 11.09 inches at Williamson and the least, 3.32 inches at Wellsburg. The greatest amount in any 24 consecutive hours was 3.83 inches at Seneca State Forest on the 29th. The average number of days with .01 inch or more of precipitation was 14.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for July 1939

VOL. XLVII   PARKERSBURG, W. VA., AUGUST 1939   No. 8

GENERAL SUMMARY

The month was very dry and only moderately warm. It was the third driest August of record, and the driest since 1925. The precipitation consisted of widely scattered showers of varying amounts and resulted in the anomalous situation of having the greatest and least monthly amounts occur at stations only about 25 miles apart. Both stations at Buckhannon had less than 0.25 inch, while Pickens had 6.33 inches. Due to elevation and exposure to rain-bearing winds, Pickens is normally the wettest station in the state. Only 5 stations reported an excess of precipitation, one each in Mineral, Hampshire, Randolph, Greenbrier, and Mercer counties. On August 14th heavy rains sent Liberty Creek out of its banks, damaging one home and blocking traffic temporarily on State Route 33, a short distance east of Spencer.

While the temperature was slightly above normal, the month actually was the coolest August since 1934. Only two stations reported deficiencies in temperature. The variability was slight and at no time were the daily mean values more than 7° from normal.

Conditions were favorable for crop growth and harvesting, but at the close of the month the lack of rainfall was being felt, especially in western and central counties.

TEMPERATURE

The average monthly temperature for the State, based on the records of 58 stations, was 72.7°, or 0.9° above the normal. The mean for the northeastern panhandle division was 72.8°; for the northern division, 72.5°; and for the southern division, 73.0°. The highest monthly mean was 77.8° at Martinsburg and the lowest, 64.1° at Bayard. The highest temperature was 99° at Williamson on the 11th and the lowest, 38° at Bayard on the 5th. The greatest daily range was 47° at Benson on the 11th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 107 stations, was 2.19 inches, or 1.86 inches below the normal. In the northeastern panhandle division the average was 2.44 inches; in the northern division, 2.09 inches; and in the southern division, 2.27 inches. The greatest monthly precipitation was 6.33 inches at Pickens and the least, 0.11 inch at Buckhannon No. 2. The greatest amount in any 24 consecutive hours was 2.25 inches at Pickens on the 25th. The average number of days with .01 inch or more of precipitation was 8.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for August 1939

VOL. XLVII PARKERSBURG, W. VA., SEPTEMBER 1939 No. 9

GENERAL SUMMARY

The month was warm, the warmest September since 1934. Temperatures were decidedly above normal during three periods in the first half and a fourth period at the close of the month. Maxima in the high 90's, and at a few stations over 100° were recorded during the 7-10th. A reading of 98° at Parkersburg on the 8th was the highest of record for that date. During the cool spell of the 18-19th, the first killing frosts of the season were reported from portions of Pocahontas and Grant Counties.

Rainfall averaged 77 per cent of normal. Drought conditions continued throughout the month in the southern and western sections. Monthly totals were above normal over a narrow belt extending from Hampshire County westward into Wetzel, Tyler and Pleasants Counties and also over a portion of Pendleton County. Totals in the southeastern counties were as little as 13 per cent of normal. The hail occurrences were of little importance. A severe thunderstorm occurred in the vicinity of the Harrison County Airport during the evening of the 29th, blowing down trees and outbuildings.

The weather was favorable for harvesting, but drought retarded crop growth and delayed Fall plowing. Pastures deteriorated, and the farm water supply in the southern and western counties became very low.

TEMPERATURE

The average monthly temperature for the State, based on the records of 61 stations, was 68.8°, or 2.3° above the normal. The mean for the northeastern panhandle division was 66.8°; for the northern division, 68.6°; and for the southern division, 69.8°. The highest monthly mean was 74.7° at Point Pleasant and the lowest, 61.0°, at Bayard. The highest temperature was 103° at Ravenswood on the 10th, and the lowest, 29° at Seneca State Forest on the 18th and 23d. The greatest daily range was 57° at Seneca State Forest on the 25th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 106 stations, was 2.22 inches, or 0.68 inch below the normal. In the northeastern panhandle division the average was 2.82 inches; in the northern division, 2.60 inches; and in the southern division, 1.27 inches. The greatest monthly precipitation was 5.22 inches at Brandywine and the least, 0.33 inch at Union. The greatest amount in any 24 consecutive hours was 2.40 inches at Brandywine on the 29th. The average number of days with .01 inch or more of precipitation was 6.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for September 1939
